<b>1 McsUsbNet.dll for MCS USB devices</b>	<b>1</b>
1.1 Introduction	1
1.2 System requirements	1
1.3 Connecting to an MCS device	1
<b>2 Device Classes</b>	<b>2</b>
2.1 The MCS FluidControl Device	2
2.1.1 Introduction	2
2.1.2 Access to the FluidControl device	2
2.2 MCS-USB-Sw2to64 device	3
<b>3 Function Classes</b>	<b>3</b>
<b>4 Data ACQuisition (DACQ) Devices</b>	<b>4</b>
<b>5 The MCS Robo Device</b>	<b>5</b>
5.1 Introduction	5
<b>6 STG200x &amp; STG400x STimulus Generator</b>	<b>5</b>
6.1 Introduction	5
6.2 Download mode	6
6.2.1 Memory Layout and Trigger Setup	6
6.3 Streaming mode	8
6.3.1 Memory Layout and Trigger Setup	9
<b>7 Namespace Index</b>	<b>11</b>
7.1 Namespace List	11
<b>8 Hierarchical Index</b>	<b>11</b>
8.1 Class Hierarchy	11
<b>9 Class Index</b>	<b>16</b>
9.1 Class List	16
<b>10 Namespace Documentation</b>	<b>22</b>
10.1 Mcs Namespace Reference	22
10.2 Mcs::Usb Namespace Reference	22
10.2.1 Enumeration Type Documentation	50
10.2.2 Function Documentation	90
<b>11 Class Documentation</b>	<b>92</b>
11.1 CW2100_FunctionNet::AudioChannelsNet Struct Reference	92
11.1.1 Member Data Documentation	92
11.2 BatteryState Class Reference	92
11.2.1 Property Documentation	92
11.3 BesselFilterHighPassNet Class Reference	93

11.3.1 Constructor & Destructor Documentation	93
11.4 BesselFilterLowPassNet Class Reference	93
11.4.1 Constructor & Destructor Documentation	94
11.5 ButterworthFilterHighPassNet Class Reference	94
11.5.1 Constructor & Destructor Documentation	94
11.6 ButterworthFilterLowPassNet Class Reference	95
11.6.1 Constructor & Destructor Documentation	95
11.7 CChannelTestDeviceNet Class Reference	95
11.7.1 Constructor & Destructor Documentation	96
11.7.2 Member Function Documentation	96
11.8 CCMOSMea_FunctionNet Class Reference	96
11.8.1 Constructor & Destructor Documentation	98
11.8.2 Member Function Documentation	99
11.9 CCMOSMeaDeviceNet Class Reference	107
11.9.1 Constructor & Destructor Documentation	108
11.9.2 Member Function Documentation	108
11.9.3 Property Documentation	110
11.10 CCreateFilterNet Class Reference	110
11.10.1 Constructor & Destructor Documentation	111
11.10.2 Member Function Documentation	111
11.10.3 Property Documentation	112
11.11 CDacCalibrationFunctionNet Class Reference	112
11.11.1 Detailed Description	113
11.11.2 Constructor & Destructor Documentation	113
11.11.3 Member Function Documentation	113
11.12 CDacqGroupChannelGenericSelectionNet Class Reference	114
11.12.1 Constructor & Destructor Documentation	115
11.13 CDacqGroupChannelSelectionNet Class Reference	115
11.13.1 Constructor & Destructor Documentation	115
11.14 CDacqGroupChannelSelectionTemplateNet< DacqGroupChannelEnumTemplateNet, DacqGroupChannelEnumTemplate, CDeviceGroupChannelInfoTemplateNet > Class Template Reference	115
11.14.1 Constructor & Destructor Documentation	116
11.14.2 Member Function Documentation	116
11.15 CDeviceGroupChannelInfoGenericNet Class Reference	118
11.15.1 Constructor & Destructor Documentation	118
11.16 CDeviceGroupChannelInfoMEA2100_256Net Class Reference	119
11.16.1 Constructor & Destructor Documentation	119
11.17 CDeviceGroupChannelInfoNet Class Reference	119
11.17.1 Constructor & Destructor Documentation	120
11.18 CDeviceGroupChannelInfoSCUNet Class Reference	120
11.18.1 Constructor & Destructor Documentation	120
11.19 CDeviceGroupChannelInfoTemplateNet< DacqGroupChannelEnumTemplateNet > Class Template Reference	120

11.19.1 Constructor & Destructor Documentation	121
11.19.2 Member Data Documentation	121
11.20 CDeviceGroupChannelInfoW2100Net Class Reference	121
11.20.1 Constructor & Destructor Documentation	122
11.21 CDigOutStimulatorFunctionNet Class Reference	122
11.21.1 Detailed Description	123
11.21.2 Constructor & Destructor Documentation	123
11.21.3 Member Function Documentation	123
11.22 CEncapsulatorDeviceNet Class Reference	126
11.22.1 Detailed Description	126
11.22.2 Constructor & Destructor Documentation	127
11.22.3 Member Function Documentation	127
11.23 CExternDTesterDeviceNet Class Reference	127
11.23.1 Detailed Description	127
11.23.2 Constructor & Destructor Documentation	128
11.23.3 Member Function Documentation	128
11.24 CFilterCoefficientsNet Class Reference	129
11.24.1 Constructor & Destructor Documentation	129
11.24.2 Member Function Documentation	130
11.24.3 Property Documentation	131
11.25 CFilterConfigurationNet Class Reference	131
11.25.1 Constructor & Destructor Documentation	131
11.25.2 Member Function Documentation	132
11.26 CFilterConfigurationRegisterNet Class Reference	133
11.26.1 Constructor & Destructor Documentation	133
11.26.2 Member Function Documentation	133
11.27 CFilterPropertyNet Class Reference	135
11.27.1 Constructor & Destructor Documentation	135
11.27.2 Member Function Documentation	135
11.27.3 Property Documentation	135
11.28 CFluidControlDeviceNet Class Reference	136
11.28.1 Detailed Description	137
11.28.2 Constructor & Destructor Documentation	138
11.28.3 Member Function Documentation	138
11.28.4 Property Documentation	143
11.29 CFYIDeviceNet Class Reference	143
11.29.1 Detailed Description	144
11.29.2 Constructor & Destructor Documentation	144
11.29.3 Property Documentation	144
11.30 CGenericDevelopDeviceNet Class Reference	145
11.30.1 Detailed Description	151
11.30.2 Constructor & Destructor Documentation	152

11.30.3 Member Function Documentation	152
11.31 CGilsonDeviceNet Class Reference	163
11.31.1 Detailed Description	164
11.31.2 Constructor & Destructor Documentation	164
11.31.3 Member Function Documentation	164
11.31.4 Member Data Documentation	165
11.32 CGrapheneFunctionNet Class Reference	165
11.32.1 Detailed Description	167
11.32.2 Constructor & Destructor Documentation	167
11.32.3 Member Function Documentation	168
11.33 CHiClampDeviceNet Class Reference	176
11.33.1 Detailed Description	177
11.33.2 Constructor & Destructor Documentation	177
11.33.3 Property Documentation	177
11.34 CHLADacqNet Class Reference	177
11.34.1 Constructor & Destructor Documentation	178
11.35 CHLADeviceNet Class Reference	178
11.35.1 Detailed Description	178
11.35.2 Constructor & Destructor Documentation	178
11.35.3 Property Documentation	179
11.36 CMcsUsbDacqNet::CHWInfo Class Reference	179
11.36.1 Detailed Description	179
11.36.2 Constructor & Destructor Documentation	180
11.36.3 Member Function Documentation	180
11.37 CIntanMea_FunctionNet Class Reference	182
11.37.1 Constructor & Destructor Documentation	182
11.37.2 Member Function Documentation	183
11.38 CInterfaceboard2FunctionNet Class Reference	184
11.38.1 Detailed Description	184
11.38.2 Constructor & Destructor Documentation	185
11.38.3 Member Function Documentation	185
11.39 CInterfaceboardFunctionNet Class Reference	186
11.39.1 Detailed Description	186
11.39.2 Constructor & Destructor Documentation	186
11.39.3 Member Function Documentation	187
11.40 CLIH3DeviceNet Class Reference	188
11.40.1 Detailed Description	190
11.40.2 Constructor & Destructor Documentation	190
11.40.3 Member Function Documentation	190
11.40.4 Property Documentation	197
11.41 CMcsBus_AxisParametersNet Class Reference	197
11.41.1 Constructor & Destructor Documentation	198

11.41.2 Member Function Documentation . . . . .	198
11.42 CMcsBus_ExtensionNet Class Reference . . . . .	199
11.42.1 Constructor & Destructor Documentation . . . . .	199
11.42.2 Member Function Documentation . . . . .	200
11.43 CMcsBus_FYIExtensionNet Class Reference . . . . .	200
11.43.1 Constructor & Destructor Documentation . . . . .	200
11.43.2 Member Function Documentation . . . . .	201
11.44 CMcsBus_MotorControlNet Class Reference . . . . .	202
11.44.1 Constructor & Destructor Documentation . . . . .	205
11.44.2 Member Function Documentation . . . . .	205
11.45 CMcsBus_SensorNet Class Reference . . . . .	219
11.45.1 Constructor & Destructor Documentation . . . . .	221
11.45.2 Member Function Documentation . . . . .	221
11.46 CMcsBus_TempSensorNet Class Reference . . . . .	229
11.46.1 Constructor & Destructor Documentation . . . . .	230
11.46.2 Member Function Documentation . . . . .	230
11.47 CMcsBus_VoltageModeNet Class Reference . . . . .	231
11.47.1 Constructor & Destructor Documentation . . . . .	232
11.47.2 Member Function Documentation . . . . .	233
11.48 CMcsBusNet Class Reference . . . . .	236
11.48.1 Constructor & Destructor Documentation . . . . .	236
11.48.2 Member Function Documentation . . . . .	237
11.49 CMcsUsbDacqNet Class Reference . . . . .	240
11.49.1 Detailed Description . . . . .	245
11.49.2 Constructor & Destructor Documentation . . . . .	246
11.49.3 Member Function Documentation . . . . .	246
11.49.4 Member Data Documentation . . . . .	286
11.49.5 Property Documentation . . . . .	287
11.49.6 Event Documentation . . . . .	287
11.50 CMcsUsbDeviceStatePushFunctionNet Class Reference . . . . .	287
11.50.1 Constructor & Destructor Documentation . . . . .	288
11.50.2 Member Function Documentation . . . . .	288
11.50.3 Event Documentation . . . . .	288
11.51 CMcsUsbDeviceStatePushNet Class Reference . . . . .	288
11.51.1 Constructor & Destructor Documentation . . . . .	289
11.51.2 Member Function Documentation . . . . .	289
11.51.3 Event Documentation . . . . .	289
11.52 CMcsUsbFactoryNet Class Reference . . . . .	289
11.52.1 Constructor & Destructor Documentation . . . . .	291
11.52.2 Member Function Documentation . . . . .	291
11.52.3 Member Data Documentation . . . . .	297
11.53 CMcsUsbFunctionNet Class Reference . . . . .	298

11.53.1 Constructor & Destructor Documentation	298
11.53.2 Member Function Documentation	299
11.53.3 Member Data Documentation	299
11.54 CMcsUsbFunctionPointerContainer Class Reference	299
11.55 CMcsUsbListEntryNet Class Reference	299
11.55.1 Detailed Description	300
11.55.2 Constructor & Destructor Documentation	300
11.55.3 Member Function Documentation	301
11.55.4 Property Documentation	304
11.56 CMcsUsbListNet Class Reference	305
11.56.1 Detailed Description	305
11.56.2 Constructor & Destructor Documentation	305
11.56.3 Member Function Documentation	306
11.56.4 Property Documentation	307
11.56.5 Event Documentation	307
11.57 CMcsUsbNet Class Reference	308
11.57.1 Detailed Description	312
11.57.2 Constructor & Destructor Documentation	312
11.57.3 Member Function Documentation	312
11.57.4 Member Data Documentation	324
11.57.5 Property Documentation	329
11.58 CMcsUsbPointerContainer Class Reference	329
11.59 CMEA2100_256DacqGroupChannelSelectionNet Class Reference	329
11.59.1 Constructor & Destructor Documentation	329
11.60 CMEA2100x256FunctionNet Class Reference	330
11.60.1 Detailed Description	330
11.60.2 Constructor & Destructor Documentation	330
11.60.3 Member Function Documentation	331
11.61 CMeaAudioFunctionNet Class Reference	331
11.61.1 Constructor & Destructor Documentation	332
11.61.2 Member Function Documentation	332
11.62 CMeaCleanDeviceNet Class Reference	334
11.62.1 Detailed Description	335
11.62.2 Constructor & Destructor Documentation	335
11.62.3 Member Function Documentation	336
11.63 CMeaCoatDeviceNet Class Reference	338
11.63.1 Detailed Description	339
11.63.2 Constructor & Destructor Documentation	340
11.63.3 Member Function Documentation	340
11.64 CMeaDeviceNet Class Reference	344
11.64.1 Detailed Description	345
11.64.2 Constructor & Destructor Documentation	345

11.64.3 Member Function Documentation . . . . .	346
11.64.4 Property Documentation . . . . .	351
11.65 CMeaDigitalDataFunctionNet Class Reference . . . . .	352
11.65.1 Constructor & Destructor Documentation . . . . .	352
11.65.2 Member Function Documentation . . . . .	353
11.66 CMeaFeedbackFunctionNet Class Reference . . . . .	354
11.66.1 Constructor & Destructor Documentation . . . . .	355
11.66.2 Member Function Documentation . . . . .	355
11.67 CMeaImpedanceDeviceNet Class Reference . . . . .	358
11.67.1 Constructor & Destructor Documentation . . . . .	358
11.67.2 Member Function Documentation . . . . .	359
11.68 CMeasureTableDeviceNet Class Reference . . . . .	359
11.68.1 Detailed Description . . . . .	360
11.68.2 Constructor & Destructor Documentation . . . . .	360
11.68.3 Property Documentation . . . . .	360
11.69 CMeaSwitchDeviceNet Class Reference . . . . .	360
11.69.1 Detailed Description . . . . .	361
11.69.2 Constructor & Destructor Documentation . . . . .	361
11.69.3 Member Function Documentation . . . . .	361
11.70 CMeaUSBDeviceNet Class Reference . . . . .	362
11.70.1 Detailed Description . . . . .	363
11.70.2 Constructor & Destructor Documentation . . . . .	363
11.71 CMeFunctionNet Class Reference . . . . .	363
11.71.1 Detailed Description . . . . .	364
11.71.2 Constructor & Destructor Documentation . . . . .	364
11.71.3 Member Function Documentation . . . . .	364
11.72 CMultiBatteryChargerDeviceNet Class Reference . . . . .	365
11.72.1 Detailed Description . . . . .	366
11.72.2 Constructor & Destructor Documentation . . . . .	366
11.72.3 Member Function Documentation . . . . .	366
11.73 CMultiwellCallbackFunctionNet Class Reference . . . . .	372
11.73.1 Detailed Description . . . . .	372
11.73.2 Constructor & Destructor Documentation . . . . .	373
11.73.3 Member Function Documentation . . . . .	373
11.73.4 Event Documentation . . . . .	374
11.74 CMultiwellDeviceNet Class Reference . . . . .	374
11.74.1 Detailed Description . . . . .	375
11.74.2 Constructor & Destructor Documentation . . . . .	375
11.74.3 Member Function Documentation . . . . .	376
11.75 CMultiwellOptoStimFunctionNet Class Reference . . . . .	380
11.75.1 Detailed Description . . . . .	381
11.75.2 Constructor & Destructor Documentation . . . . .	381

11.75.3 Member Function Documentation	381
11.76 CNF_GenDeviceNet Class Reference	385
11.76.1 Constructor & Destructor Documentation	385
11.76.2 Member Function Documentation	385
11.77 COctoPotDeviceNet Class Reference	386
11.77.1 Constructor & Destructor Documentation	386
11.77.2 Member Function Documentation	387
11.78 COkuvisionStimulatorDeviceNet Class Reference	390
11.78.1 Constructor & Destructor Documentation	391
11.78.2 Member Function Documentation	391
11.79 CPatchServerDeviceNet Class Reference	393
11.79.1 Detailed Description	394
11.79.2 Constructor & Destructor Documentation	394
11.79.3 Property Documentation	394
11.80 CPathIdentDeviceNet Class Reference	394
11.80.1 Constructor & Destructor Documentation	395
11.80.2 Member Function Documentation	395
11.81 CPedoterDeviceNet Class Reference	395
11.81.1 Detailed Description	396
11.81.2 Constructor & Destructor Documentation	396
11.81.3 Member Function Documentation	396
11.82 CPeristalticPumpDeviceNet Class Reference	397
11.82.1 Detailed Description	397
11.82.2 Constructor & Destructor Documentation	397
11.82.3 Property Documentation	398
11.83 CPgaDeviceNet Class Reference	398
11.83.1 Constructor & Destructor Documentation	398
11.83.2 Member Function Documentation	399
11.84 CPositionIIDeviceNet Class Reference	400
11.84.1 Detailed Description	402
11.84.2 Constructor & Destructor Documentation	402
11.84.3 Member Function Documentation	402
11.84.4 Property Documentation	409
11.85 CPositionImpDeviceNet Class Reference	409
11.85.1 Detailed Description	409
11.85.2 Constructor & Destructor Documentation	410
11.85.3 Member Function Documentation	410
11.86 CPPCDeviceNet Class Reference	412
11.86.1 Constructor & Destructor Documentation	412
11.86.2 Property Documentation	413
11.87 CPPCFunctionNet Class Reference	413
11.87.1 Detailed Description	414

11.87.2 Constructor & Destructor Documentation	414
11.87.3 Member Function Documentation	415
11.88 CPPS_DeviceNet Class Reference	422
11.88.1 Constructor & Destructor Documentation	422
11.88.2 Property Documentation	422
11.89 CPPS_FunctionNet Class Reference	423
11.89.1 Constructor & Destructor Documentation	423
11.89.2 Member Function Documentation	424
11.90 CPPSDeviceNet Class Reference	427
11.90.1 Detailed Description	427
11.90.2 Constructor & Destructor Documentation	428
11.91 CProgramPressureCurveNet Class Reference	428
11.91.1 Detailed Description	428
11.91.2 Constructor & Destructor Documentation	428
11.91.3 Member Function Documentation	429
11.92 CPulseGeneratorFunctionNet Class Reference	429
11.92.1 Detailed Description	430
11.92.2 Constructor & Destructor Documentation	430
11.92.3 Member Function Documentation	431
11.93 CRadioControlledDevicesNet Class Reference	432
11.93.1 Constructor & Destructor Documentation	433
11.93.2 Member Function Documentation	433
11.94 CCMOSMeaDeviceNet::CRegionOfInterestRect Class Reference	434
11.94.1 Constructor & Destructor Documentation	434
11.94.2 Member Function Documentation	434
11.94.3 Member Data Documentation	435
11.95 CRetinaLedDeviceNet Class Reference	435
11.95.1 Constructor & Destructor Documentation	436
11.95.2 Member Function Documentation	436
11.96 CRFFFunctionNet Class Reference	437
11.96.1 Detailed Description	438
11.96.2 Constructor & Destructor Documentation	438
11.96.3 Member Function Documentation	438
11.97 CRobo_FYIPProgram_FunctionNet Class Reference	442
11.97.1 Constructor & Destructor Documentation	442
11.97.2 Member Function Documentation	442
11.98 CRobo_FYITemp_FunctionNet Class Reference	443
11.98.1 Constructor & Destructor Documentation	444
11.98.2 Member Function Documentation	444
11.99 CRoboDacqNet Class Reference	445
11.99.1 Constructor & Destructor Documentation	448
11.99.2 Member Function Documentation	448

11.99.3 Member Data Documentation . . . . .	459
11.100 CRoboDeviceNet Class Reference . . . . .	460
11.100.1 Detailed Description . . . . .	463
11.100.2 Constructor & Destructor Documentation . . . . .	463
11.100.3 Member Function Documentation . . . . .	463
11.100.4 Member Data Documentation . . . . .	471
11.100.5 Property Documentation . . . . .	475
11.100.6 Event Documentation . . . . .	476
11.101 CRoboFluidDeviceNet Class Reference . . . . .	476
11.101.1 Constructor & Destructor Documentation . . . . .	477
11.101.2 Member Function Documentation . . . . .	477
11.101.3 Member Data Documentation . . . . .	479
11.101.4 Property Documentation . . . . .	479
11.102 CRoboInjectDeviceNet Class Reference . . . . .	479
11.102.1 Detailed Description . . . . .	480
11.102.2 Constructor & Destructor Documentation . . . . .	480
11.103 CRoboocyte2DeviceNet Class Reference . . . . .	480
11.103.1 Detailed Description . . . . .	480
11.103.2 Constructor & Destructor Documentation . . . . .	481
11.103.3 Member Function Documentation . . . . .	481
11.104 CRoboStatorDeviceNet Class Reference . . . . .	481
11.104.1 Constructor & Destructor Documentation . . . . .	483
11.104.2 Member Function Documentation . . . . .	483
11.104.3 Property Documentation . . . . .	487
11.105 CSafeISDeviceNet Class Reference . . . . .	487
11.105.1 Detailed Description . . . . .	488
11.105.2 Constructor & Destructor Documentation . . . . .	488
11.105.3 Member Function Documentation . . . . .	489
11.105.4 Property Documentation . . . . .	490
11.106 CSCUDacqGroupChannelSelectionNet Class Reference . . . . .	490
11.106.1 Constructor & Destructor Documentation . . . . .	491
11.107 CSCUFunctionNet Class Reference . . . . .	491
11.107.1 Detailed Description . . . . .	493
11.107.2 Constructor & Destructor Documentation . . . . .	493
11.107.3 Member Function Documentation . . . . .	494
11.107.4 Event Documentation . . . . .	505
11.108 CSerialPortNet Class Reference . . . . .	506
11.108.1 Constructor & Destructor Documentation . . . . .	506

## 1 McsUsbNet.dll for MCS USB devices

### 1.1 Introduction

This DLL provides the .NET interface to MCS devices

The most important options are accessing our stimulator and data acquisition devices:

- [STG200x & STG400x STimulus Generator](#)
- [Data ACQuisition \(DACQ\) Devices](#)

See here for a list of our other devices: [Device Classes](#).

And here for a list of function classes addressing groups of features that might be shared between different devices: [Function Classes](#).

### 1.2 System requirements

The DLL can be used with any .NET compatible language.

The DLL needs the **.NET Framework 4.7.2**.

It requires the **Microsoft Visual C++ Redistributable for Visual Studio 2019** to be installed.

It also requires the **USB driver** to be installed.

The simplest way to achieve this is to install the latest **Multi Channel Experimenter** setup (will install 64bit redistributable).

All examples assume that the [Mcs.Usb](#) namespace is loaded:

```
using namespace Mcs.Usb;
```

Include the file McsUsbNet.dll into the references of your project.

### 1.3 Connecting to an MCS device

A connection to a DAQ device is established by [Mcs.Usb.CMcsUsbNet.Connect](#). When this function is called without argument, the first DAQ device found on the USB bus is used:

```
CMcsUsbNet device = new CMcsUsbNet();
device.Connect();
```

When more than one DAQ device of the specific type is connected, you can use the [Mcs.Usb.CMcsUsbListNet](#) class to get a list of available devices:

```
CMcsUsbListNet usblst = new CMcsUsbListNet(DeviceEnumNet.MCS_DEVICE_USB);
var entry = usblst.GetUsbListEntry((uint)0);
CMcsUsbNet device = new CMcsUsbNet();
device.Connect(entry);
```

After you are finished with the device, you can disconnect the device object from the device by:

```
device.Disconnect();
```

## 2 Device Classes

- For FluidControl device see [MCS FluidControl](#)
- For SW2TO64 device see [MCS-USB-Sw2to64](#)
- For TCx device see [Mcs.Usb.CTcxDeviceNet](#)

### 2.1 The MCS FluidControl Device

#### 2.1.1 Introduction

The FluidControl Device can control up to 24 valves. The nominal voltage is 24V.

8 TTL level digital output ports are available and 8 TTL inputs can be read in.

The device has 8 ADC inputs with a range from 0V to 3.3V.

#### 2.1.2 Access to the FluidControl device

For connecting to a FluidControl device see [Connecting to an MCS device.\\*](#)

```
CFluidControlDevice* m_dacq;  
m_fluidcontrol = new CFluidControlDevice;  
status = m_fluidcontrol->Connect();
```

The valves are controlled with the CFluidControlDevice::SetValve call. The argument given is a bit pattern of all valves which should be open.

The digital outputs can be controlled with the CFluidControlDevice::SetDigout call. Again, a bit pattern of all digital output pins which should be set to a logic high level is given as an argument.

The current state of the valves and the digital outputs can be read back with the CFluidControlDevice::GetValve and CFluidControlDevice::GetDigout

The command to read an ADC-Channel is CFluidControlDevice::GetAdc. Here the channelnummer which should be read in is given as an argument and the return value is the current Adc level.

The state of the digital inputs is read with the CFluidControlDevice::GetDigin call. Here the return value is the bit pattern of the digital inputs.

The connection to the device is closed with the CFluidControlDevice::Disconnect call.

## 2.2 MCS-USB-Sw2to64 device

The class [Mcs.Usb.CSw2to64DeviceNet](#) controls the setting of the switches in the MCS-USB-Sw2to64 device.

First construct an object of the class:

```
CSw2to64DeviceNet device = new CSw2to64DeviceNet();
```

For connecting to an MCS-USB-Sw2to64 device see [Connecting to an MCS device](#).

To get the number of channels the device handles:

```
int number = device.GetNumber();
```

Set all channel switches at once:

```
byte z = 1;
byte[] pattern = new byte[number];
for(int i = 0; i < number; i++)
{
    pattern[i] = z; // pattern you want to switch this channel to
}
device.SetChannels(pattern);
```

Get all channel switches at once:

```
byte[] pattern = device.GetChannels();
```

Set one channel switch:

```
ushort index = 10;
byte pattern = 1;
device.SetChannel(index, pattern)
```

Get one channel switch:

```
ushort index = 10;
byte pattern = device.GetChannel(index);
```

## 3 Function Classes

- [Mcs.Usb.CCMOSMea\\_FunctionNet](#)
- [Mcs.Usb.CDacCalibrationFunctionNet](#)
- [Mcs.Usb.CDigOutStimulatorFunctionNet](#)
- [Mcs.Usb.CGrapheneFunctionNet](#)
- [Mcs.Usb.CIntanMea\\_FunctionNet](#)

- [Mcs.Usb.CMultiwellOptoStimFunctionNet](#)
- [Mcs.Usb.CPPCFunctionNet](#)
- [Mcs.Usb.CPPS\\_FunctionNet](#)
- [Mcs.Usb.CPulseGeneratorFunctionNet](#)
- [Mcs.Usb.CRFFunctionNet](#)
- [Mcs.Usb.CRobo\\_FYITemp\\_FunctionNet](#)
- [Mcs.Usb.CRobo\\_FYIProgram\\_FunctionNet](#)
- [Mcs.Usb.CSCUFunctionNet](#)
- [Mcs.Usb.CStimulusFunctionNet](#)
- [Mcs.Usb.CTEERFunctionNet](#)
- [Mcs.Usb.CW2100\\_FunctionNet](#)
- [Mcs.Usb.CW2100\\_StimulatorFunctionNet](#)
- [Mcs.Usb.CWarnerUssingFunctionNet](#)
- [Mcs.Usb.CWarnerValveControllerDeviceTesterFunctionNet](#)
- [Mcs.Usb.CWClassicFunctionNet](#)
- [Mcs.Usb.CWirelessBaseFunctionNet](#)

## 4 Data ACQuisition (DACQ) Devices

There are different device types of (MEA) data acquisition (DACQ) devices. All of them are supported by this class.

This library does **not** support the writing of the MCD (MC\_Rack), MSRD (Multi Channel Experimenter) or HDF5 file format!

The class [Mcs.Usb.CMeaDeviceNet](#) is the base class for DACQ devices.

The base class [Mcs.Usb.CMeaDeviceNet](#) constructs actually the underlying classes for USB-MEA devices ([Mcs.Usb.CMeaUSBDeviceNet](#)).

```
CMeaDeviceNet device = new CMeaDeviceNet(McsBusTypeEnumNet.MCS_USB_BUS, OnChannelData, OnError);
```

For connecting to a DACQ device see [Connecting to an MCS device](#).

Get the number of available analog hardware channels and set the number of channels to the maximum.

```
int hwchannels;
device.HWInfo().GetNumberOfHWADCCChannels(out hwchannels);
device.SetNumberOfChannels(hwchannels);
int samplingrate = 1000;
device.SetSamplerate(samplingrate, 1, 0);
device.EnableDigitalIn(true, 0);
```

Get the layout to know how the data look like that you receive

```
int ana, digi, che, tim, block;
device.GetChannelLayout(out ana, out digi, out che, out tim, out block);
```

For the [Mcs.Usb.OnChannelData](#) callback function you have to provide a definition of the channels you want to receive.

```
bool[] selChannels = new bool[block];
for (int i = 0; i < block; i++)
{
    selChannels[i] = true; // With true channel i is selected
    // selChannels[i] = false; // With false the channel i is deselected
}
channelblocksize = samplingrate / 10;
// queue size and threshold should be selected carefully
device.SetSelectedChannels(selChannels, 10 * channelblocksize, channelblocksize);
```

The [Mcs.Usb.OnChannelData](#) callback function gets a callback for each channelblock that is defined. In this example a callback for each channel.

```
void OnChannelData(CMcsUsbDacqNet d, int cbHandle, int numSamples)
{
    int size_ret;
    ushort[] channeldata = device.ChannelBlock_ReadFramesUI16(CbHandle, numSamples, out size_ret);
}
void OnError(String msg, int info)
{
    MessageBox.Show("Mea Device Error: " + msg);
}
```

see MEA\_Recording in the Examples directory.

## 5 The MCS Robo Device

### 5.1 Introduction

Up to now two MCS devices exist that base on the Robo platform.

- The MCS Roboinject device is controlled by the [Mcs.Usb.CRoboInjectDeviceNet](#) class.
- The MCS Roboocyte2 device is controlled by the [Mcs.Usb.CRoboocyte2DeviceNet](#) class.

Both classes are derived from [Mcs.Usb.CRoboDeviceNet](#)

## 6 STG200x & STG400x STimulus Generator

### 6.1 Introduction

The STG200x & STG400x Series Stimulus Generators have two distinct modes of operation, the [Download mode](#) and the [Streaming mode](#).

## 6.2 Download mode

The Download mode is the "classic" mode of operation, as used by the MC Stimulus software. In this mode, one or multiple waveforms are defined in PC memory and downloaded to the STG. The waveforms are stored in STG device onboard memory and can be sent to the analog and sync outputs once or multiple times. The STG can operate independantly from the PC (without computer connection) after the download. Output is triggered either by the front panel start/stop button, the digital trigger inputs or under software control.

In the Download mode, there are up to eight independent triggers available (depending on the device). The user can assign each of the analog outputs and sync (digital) outputs to any of the triggers.

The analog output waveform is stored sample by sample in the STG memory. To reduce memory usage, this data can be compressed: whenever a given output value is to be held for more than one sample period, it has only to be given once. The user can define the number of sample periods for that a pattern should remain active. Compression is done for each channel independantly of the others, thus the algorithm to compress the data is very easy to implement.

A new feature of the Download mode is the segmentation of the STG memory. The onboard memory can be divided into up to 100 segments. Each segment can hold its own waveform pattern. Under software control, the user can switch between the defined segments within milliseconds. Another option is to use the four trigger inputs to select between four predefined segments. This option is accessible from the MC\_Stimulus Software as the "Multi-File mode", and can start each of up to four defined waveforms within microseconds. This feature allows a predefined flexible response (feedback) to recorded data.

[Mcs.Usb.CStg200xDownloadNet](#) is the class for using the STG in download mode.

### 6.2.1 Memory Layout and Trigger Setup

The class to be used for the Download mode is [Mcs.Usb.CStg200xDownloadNet](#), which is derived from [Mcs.Usb.CStg200xBasicNet](#). You can add a poll handler delegate ([Mcs.Usb.OnStg200xPollStatus](#)) to the constructor [Mcs.Usb.CStg200xDownloadNet](#).

For connecting to an STG see [Connecting to an MCS device](#).

To use the Download mode, the memory layout of the STG200x can be set up, if the default is not sufficient. The total amount of memory available in the STG is obtained by the [Mcs.Usb.CStg200xDownloadNet.GetTotalMemory](#) call. With [Mcs.Usb.CStg200xDownloadNet.SendSegmentDefine](#) the segment sizes are assigned.

```
uint32_t memory = device.GetTotalMemory(); // obtain total memory available
uint[] segmentmemory = new uint[2];      // each segments has half of total memory
segmentmemory[0] = memory / 2;
segmentmemory[1] = memory / 2;
device.SendSegmentDefine(segmentmemory); // setup the STG
```

Next, for each segment, one has to assign the amount of memory to be used for each channel and sync output. This is done by [Mcs.Usb.CStg200xDownloadBasicNet.SetCapacity](#). Its arguments contain a list of memory sizes, with one entry per channel and one entry per sync output. Again, the total memory assigned to the channels and sync outputs must not exceed the memory assigned to the segment.

```
uint32_t nchannels = device.GetNumberOfAnalogChannels();
uint32_t nsync = device.GetNumberOfSyncoutChannels();
uint[] channel_cap = new uint[nchannels];
uint[] syncout_cap = new uint[nsync];
for (int i = 0; i < 2; i++) // for each segment
{
    device.SendSegmentSelect((uint32_t)i); // switch to segment
    uint32_t segment_mem = device.GetMemory(); // get memory available in this segment
    for(int j = 0; j < nchannels; j++)
    {
        channel_cap[j] = segment_mem/(nchannels+nsync); // devide memory amount to all channels
    }
    for(int j = 0; j < nsync; j++)
    {
        syncout_cap[j] = segment_mem/(nchannels+nsync); // and all sync outs.
    }
    device.SetCapacity(channel_cap, syncout_cap); // define memory for current segment
}
```

```
}
```

Before the STG can start, the trigger has to be configured. This is done by the [Mcs.Usb.CStg200xDownloadNet.SetupTrigger](#) call. Its arguments are a list of channelmaps, syncoutmaps and repeats, one for each of the four available triggers. channelmap is a bitmap, each bit representing one of the available channels. To assign channel 1 and syncout 1 to trigger 1 and channel 3 to trigger 2 use:

```
uint32_t TriggerInputs = device.GetNumberOfTriggerInputs();
uint[] channelmap = new uint[TriggerInputs];
uint[] syncoutmap = new uint[TriggerInputs];
uint[] repeat = new uint[TriggerInputs];
for (int i = 0; i < TriggerInputs; i++)
{
    channelmap[i] = 0;
    syncoutmap[i] = 0;
    repeat[i] = 0;
}
// Trigger 0
channelmap[0] = 1; // Channel 1
syncoutmap[0] = 1; // Syncout 1
repeat[0] = 0; // forever
// Trigger 1
channelmap[1] = 4; // Channel 3
device.SetupTrigger(channelmap, syncoutmap, repeat);
```

For the STG400x series you have to set the output mode of the channels. [Mcs.Usb.CStg200xDownloadNet.SetVoltageMode](#) interprets the values as voltages. [Mcs.Usb.CStg200xDownloadNet.SetCurrentMode](#) as currents.

```
// Only meaningful for STG400x
device.SetVoltageMode();
```

For each segment, data can be sent to each of the defined channels and sync outputs using the [Mcs.Usb.CStg200xDownloadNet.SendChannelData](#) and [Mcs.Usb.CStg200xDownloadNet.SendSyncData](#) calls. channeldata and syncdata are a list of analog and digital samples as a list of two byte values (unsigned short). Multiple calls to [Mcs.Usb.CStg200xDownloadNet.SendChannelData](#) and [Mcs.Usb.CStg200xDownloadNet.SendSyncData](#) to the same channel append data to that channel.

If the Multi-File mode of the STG is enabled using the [Mcs.Usb.CStg200xDownloadNet.EnableMultiFileMode](#) call, the four trigger inputs are used to switch between four segments. A hardware trigger signal (TTL) on trigger input 1 selects the first segment and starts all pulses in this segment. Thus with the Multi-File mode, one can predefine four stimulus patterns and switch between them without a connection to the PC.

The STG200x series has an analog resolution of 13 bits, thus the analog data contains the information in bits 0 to 12 of each sample. Bits 13 to 15 have to be 0.

```
int DACResolution = device.GetDACResolution();
// Data for Channel 0
{
    device.ClearChannelData(0);
    double factor = 0.1;
    const int l = 1000;
    ushort[] pData = new ushort[l];
    UInt64_t[] tData = new UInt64_t[l];
    for (int i = 0; i < l; i++)
    {
        // calculate Sin-Wave
        double sin = factor * (Math.Pow(2, DACResolution - 1) - 1.0) *
            Math.Sin(2.0 * (double)i * Math.PI / (double)l);
        // calculate sign
        pData[i] = sin >= 0 ? (ushort)sin : (ushort)((int)Math.Abs(sin) +
            (int)Math.Pow(2, DACResolution - 1));
        tData[i] = (UInt64_t)20; // duration in µs
    }
    device.SendChannelData(0, pData, tData);
}
// Data for Channel 3
{
    device.ClearChannelData(2);
    double factor = 0.1;
    const int l = 700;
    // without compression
    ushort[] pData = new ushort[l];
    UInt64_t[] tData = new UInt64_t[l];
    for (int i = 0; i < l; i++)
    {
        // calculate Sin-Wave
        double sin = factor * (Math.Pow(2, DACResolution - 1) - 1.0) *
            Math.Sin(2.0 * (double)i * Math.PI / (double)l);
        // calculate sign
```

```

        pData[i] = sin >= 0 ? (ushort)sin : (ushort)((int)Math.Abs(sin) +
            (int)Math.Pow(2, DACResolution - 1));
        tData[i] = (UInt64_t)20; // duration in µs
    }
    device.SendChannelData(2, pData, tData);
}
// Data for Sync 0
{
    device.ClearSyncData(0);
    ushort[] pData = new ushort[1000];
    UInt64_t[] tData = new UInt64_t[1000];
    for (int i = 0; i < 1000; i++)
    {
        pData[i] = (ushort)(i&1);
        tData[i] = 20;
    }
    device.SendSyncData(0, pData, tData);
}

```

Start the trigger by pushing the front button or by software

```

// Start Trigger 1 and 2
device.SendStart(1 + 2); // Trigger 1 und 2

```

see the StgDownloadExampleNet in the example directory.

## 6.3 Streaming mode

The other mode of operation is the Streaming mode. Here the analog output is sent to the STG device in "real time". The PC has to be connected to the STG all the time. The data that is sent to the analog output is downloaded from the PC to the STG on the fly.

The Streaming mode is useful for applications where flexible feedback is needed as well for applications where very long waveforms which are not repeated (such as white noise) are used.

The Streaming mode works by use of two ring buffers which hold data. One is in PC memory and managed by the DLL, and one is in on-board STG memory. Data is transferred from PC memory to the STG via the USB bus in time slices of one millisecond.

The user can define both the size of the ring buffer in DLL memory and in the STG memory. Once the Streaming mode is started, the STG request data from the PC. The data rate from PC to STG is variable and controlled by the STG. The STG request data from the PC at a rate to keep its internal ringbuffer at about half full.

It is the responsibility of the user to keep the ring buffer in the memory of the PC filled, so the DLL can supply sufficient data to the STG. To do so, the Windows DLL allows to define a "callback" function which is called whenever new data is needed, or more precise, as soon as the ring buffer in the memory of the PC falls below the user defined threshold.

Small buffers have the advantage of a low latency between data generation in the callback function and its output as a analog signal from the STG. However for low latency to work, the user-written callback function has to be fast and to produce a steady flow of data.

In the Streaming mode, all triggers are available as well. Each of the eight analog and sync outputs can be assigned to one of the triggers.

The output rate is user defined with a maximum of 50 kHz

Mcs.Usb.CStg200xStreamingNet is the class for using the STG in streaming mode.

### 6.3.1 Memory Layout and Trigger Setup

With the constructor for `Mcs.Usb.CStg200xStreamingNet.CStg200xStreamingNet`, the name of the callback function for the data handler is provided. The data handler function is called automatically, whenever the STG needs new data. This data is first written to a ring buffer in the memory of the PC. The size for this ring buffer is defined as first argument in the constructor. The user provided delegate gets the trigger number which needs new data as argument

```
CStg200xStreamingNet device = new CStg200xStreamingNet(10000, dataHandler, errorHandler);
```

The callback function, which is defined in the constructor, is called whenever the STG needs new data for a trigger, or more precise, whenever the ring buffer in PC memory falls below the defined threshold.

The user can query the amount of space available for queuing by use of the `Mcs.Usb.CStg200xStreamingNet.GetDataQueueSpace` call. Its return value is the number of samples that can be send to the STG.

User code is required to fill an array analog and sync out data, sample by sample for up to the maximum number of samples as obtained by `Mcs.Usb.CStg200xStreamingNet.GetDataQueueSpace` or `Mcs.Usb.CStg200xStreamingNet.GetSyncoutQueueSpace`.

The values for the analog outputs are 16 bits signed integers. The lower bits are truncated according to the resolution of the STG. This behaviour is different to the behaviour in [download mode](#).

Note: Compression as described in the [download mode](#) can NOT be used for the streaming mode.

The new data is sent to the STG by using the `Mcs.Usb.CStg200xStreamingNet.EnqueueData` call.

```
void dataHandler(uint32_t trigger)
{
    double factor = 1;
    if (trigger == 0) // Callback for Trigger 1
    {
        // Handle Channel 1
        uint32_t channel = 0;
        for ( ; ; )
        {
            uint32_t space = device.GetDataQueueSpace(channel);
            if (space < 1000)
                break;
            short[] data = new short[1000];
            for (int i = 0; i < 1000; i++)
            {
                // Calc Sin-Wave (16 bits) lower bits will be removed according resolution
                double sin = factor * (Math.Pow(2, 16 - 1) - 1.0) *
                    Math.Sin(2.0 * (double)i * Math.PI / (double)1000);
                data[i] = (short)sin;
            }
            uint32_t enqueued = device.EnqueueData(channel, data);
        }
    }
    // Handle Channel 3
    uint32_t channel = 2;
    for ( ; ; )
    {
        uint32_t space = device.GetDataQueueSpace(channel);
        if (space < 700)
            break;
        short[] data = new short[700];
        for (int i = 0; i < 700; i++)
        {
            // Calc Sin-Wave (16 bits) lower bits will be removed according resolution
            double sin = factor * (Math.Pow(2, 16 - 1) - 1.0) *
                Math.Sin(2.0 * (double)i * Math.PI / (double)700);
            data[i] = (short)sin;
        }
        uint32_t enqueued = device.EnqueueData(channel, data);
    }
}
// Handle Syncout 1
uint32_t channel = 0;
for ( ; ; )
{
    uint32_t space = device.GetSyncoutQueueSpace(channel);
    if (space < 1000)
        break;
    ushort[] data = new ushort[1000];
    for (int i = 0; i < 1000; i++)
```

```

        data[i] = (ushort)(i & 1);
        uint32_t enqueued = device.EnqueueSyncout(channel, data);
    }
}
}
}
void errorHandler()
{
}

```

For connecting to an STG device see [Connecting to an MCS device](#).

With enabling or disabling the continuous mode it can be selected how the STG handles an "out of data" situation.

When `Mcs.Usb.CStg200xStreamingNet.EnableContinuousMode` is used, the STG does not stop when it runs out of data, but it keeps running and sends a zero voltage to its outputs.

When `Mcs.Usb.CStg200xStreamingNet.DisableContinuousMode` is used, the STG stops when it runs out of data. It has to be retriggered to resume the output.

```
device.EnableContinuousMode();
```

`Mcs.Usb.CStg200xStreamingNet.SetOutputRate` is used to set the sampling rate.

```
device.SetOutputRate(50000);
```

To use the Streaming mode, the memory layout of the STG has to be set up. To total amount of memory available in the STG is obtained by the `Mcs.Usb.CStg200xStreamingNet.GetTotalMemory` call.

This memory can be assigned to four ring buffers (one per trigger) which buffer the data received from the PC via USB cable. This is done with the `CStg200xStreaming::SetCapacity` call. The total amount of memory must not exceed the total memory size as obtained by `Mcs.Usb.CStg200xStreamingNet.GetTotalMemory`.

This internal ring buffer is crucial for proper operation of the Streaming mode. The size of the ring buffer determines the latency of the Streaming mode. The firmware of the STG requests data from the PC in order to keep the ring buffer about half full. Thus the average latency is:

$$\text{latency} = (\text{ringbuffersize in bytes}/4) / \text{output rate}$$

If the ring buffer size is too big, the latency of the STG might be too long. If the ring buffer size is too low, an overflow or underflow of data in the STG ringbuffer might occur, resulting in data jumps of the output signals or the "out of data" situation described earlier.

The following example divides the total memory equally among the four triggers:

```

uint32_t dwMemory = device.GetTotalMemory(); // obtain total memory available
uint32_t ntrigger = device.GetNumberOfTriggerInputs(); // obtain number of triggers in this STG
uint[] stg_triggercapacity = new uint[ntrigger];
for (int i = 0; i < ntrigger; i++)
    stg_triggercapacity[i] = dwMemory / ntrigger;
device.SetCapacity(stg_triggercapacity); // setup the STG

```

or fixed memory sizes:

```

uint32_t ntrigger = device.GetNumberOfTriggerInputs(); // obtain number of triggers in this STG
uint[] stg_triggercapacity = new uint[ntrigger];
for (int i = 0; i < ntrigger; i++)
    stg_triggercapacity[i] = 50000;
device.SetCapacity(stg_triggercapacity);

```

Before the STG can start, the trigger has to be configured. This is done by the `Mcs.Usb.CStg200xStreamingNet.SetupTrigger` call. Its arguments are a list of channelmaps, syncoutmaps, digoutmap, autostart and callback←\_threshold, with one entry for each of the available triggers. channelmap is a bitmap, each bit representing one of the available channels. To assign channel 1 and 3 and syncout 1 to trigger 1 use:

```

uint32_t ntrigger = device.GetNumberOfTriggerInputs(); // obtain number of triggers in this STG
uint[] channelmap = new uint[ntrigger];
uint[] syncoutmap = new uint[ntrigger];
uint[] digoutmap = new uint[ntrigger];
uint[] autostart = new uint[ntrigger];
uint[] callback_threshold = new uint[ntrigger];
for (int i = 0; i < ntrigger; i++)
{
    channelmap[i] = 0;

```

```

    syncoutmap[i] = 0;
    digoutmap[i] = 0;
    autostart[i] = 0;
    callback_threshold[i] = 0;
}
channelmap[0] = 0x1 + 0x4; // Channel 1 und Channel 3 to Trigger 1
syncoutmap[0] = 0x1; // Syncout 1 to Trigger 1
autostart[0] = 1;
callback_threshold[0] = 50; // 50% of buffer size
device.SetupTrigger(channelmap, syncoutmap, digoutmap, autostart, callback_threshold);
device.StartLoop();
System.Threading.Thread.Sleep(1000); // Give StartLoop some time

```

Start Trigger by pushing the front button or by Software

```
device.SendStart(1);
```

see the StgStreamingExampleNet in the example directory.

## 7 Namespace Index

### 7.1 Namespace List

Here is a list of all namespaces with brief descriptions:

## 10 Namespace Documentation

### 10.1 Mcs Namespace Reference

#### Namespaces

- [Usb](#)

### 10.2 Mcs::Usb Namespace Reference

#### Classes

- class [CChannelTestDeviceNet](#)
- class [CCMOSMea\\_FunctionNet](#)
- class [CCMOSMeaDeviceNet](#)
- class [CCreateFilterNet](#)
- class [ButterworthFilterLowPassNet](#)
- class [ButterworthFilterHighPassNet](#)
- class [BesselFilterLowPassNet](#)
- class [BesselFilterHighPassNet](#)

- class [CDeviceGroupChannelInfoTemplateNet](#)
- class [CDeviceGroupChannelInfoGenericNet](#)
- class [CDeviceGroupChannelInfoNet](#)
- class [CDeviceGroupChannelInfoW2100Net](#)
- class [CDeviceGroupChannelInfoSCUNet](#)
- class [CDeviceGroupChannelInfoMEA2100\\_256Net](#)
- class [CDacqGroupChannelSelectionTemplateNet](#)
- class [CDacqGroupChannelGenericSelectionNet](#)
- class [CDacqGroupChannelSelectionNet](#)
- class [CW2100DacqGroupChannelSelectionNet](#)
- class [CSCUDacqGroupChannelSelectionNet](#)
- class [CMEA2100\\_256DacqGroupChannelSelectionNet](#)
- class [CDacCalibrationFunctionNet](#)
- class [CDigOutStimulatorFunctionNet](#)
  - [CDigOutStimulatorFunctionNet](#) is the class of the DigOut stimulator function class.*
- class [CExternDTesterDeviceNet](#)
  - [CExternDTesterDeviceNet](#) is the class to access the ExternD Tester (Handheld Device Tester D)*
- class [CGrapheneFunctionNet](#)
  - [CGrapheneFunctionNet](#) is the class to control Graphene device functions*
- class [CInterfaceboard2FunctionNet](#)
  - [CInterfaceboard2FunctionNet](#) is the class to control the Interfaceboard*
- class [CInterfaceboardFunctionNet](#)
  - [CInterfaceboardFunctionNet](#) is the class to control the Interfaceboard*
- class [CLIH3DeviceNet](#)
  - [CLIH3DeviceNet](#) is the class to access the HEKA LIH3 device.*
- class [CMEA2100x256FunctionNet](#)
  - [CMEA2100x256FunctionNet](#) is the class to control the MEA2100-256 device needs #include "Stg200xNet.h" to resolve documentation reference*
- class [CMeaCleanDeviceNet](#)
  - [CMeaCleanDeviceNet](#) is the class to access the MEA Clean device.*
- class [CMeaCoatDeviceNet](#)
  - [CMeaCoatDeviceNet](#) is the class to access the MEA Coat device.*
- class [CMultiBatteryChargerDeviceNet](#)
  - [CMultiBatteryChargerDeviceNet](#) is the class to access the MBC-08 device.*
- class [CMultiwellCallbackFunctionNet](#)
  - [CMultiwellCallbackFunctionNet](#) is the class to access the Multiwell-Mini-Stimulator*
- class [CMultiwellDeviceNet](#)
  - [CMultiwellDeviceNet](#) is the class to access the Multiwell device.*
- class [CMultiwellOptoStimFunctionNet](#)
  - [CMultiwellOptoStimFunctionNet](#) is the class to access the optical properties of the Multiwell Optostim device*
- class [CPedoterDeviceNet](#)
- class [CPositionIIDeviceNet](#)
  - [CPositionIIDeviceNet](#) is the class to control PositionII devices*
- class [CPositionImpDeviceNet](#)
  - [CPositionImpDeviceNet](#) is the class to access the Position/Imp devices*
- class [CPPCFunctionNet](#)
  - [CPPCFunctionNet](#) is the class to access the PPC (high precision Patch Peristaltic patch Pump*
- class [CPulseGeneratorFunctionNet](#)
  - [CPulseGeneratorFunctionNet](#) is the class to control the pulse generator for video tracking*
- class [CRFFFunctionNet](#)
  - [CRFFFunctionNet](#) is the class to control RF devices*
- class [CSCUFunctionNet](#)

- CSCUFunctionNet* is the class to control the SCU device
- class [CTEERFunctionNet](#)
  - CTEERFunctionNet* is the class to control the TEER device
- class [CUsbDeviceConfigurationFunctionNet](#)
  - CUsbDeviceConfigurationFunctionNet* is the class to configure the USB firmware
- class [CWarnerUssingDeviceNet](#)
  - CWarnerUssingDeviceNet* is the class to control the Ussing device
- class [CWarnerUssingFunctionNet](#)
  - CWarnerUssingFunctionNet* is the class to control the Ussing device
- class [CWarnerValveControllerDeviceNet](#)
  - CWarnerValveControllerDeviceNet* is the class to access the Warner Valve Controller
- class [CWarnerValveControllerDeviceTesterFunctionNet](#)
  - CWarnerValveControllerDeviceTesterFunctionNet* is the class to access the functions for the Warner Valve Controller Device Tester
- struct [DeviceldNet](#)
  - Device Id.*
- class [CFilterCoefficientsNet](#)
- class [CFilterConfigurationNet](#)
- class [CFilterConfigurationRegisterNet](#)
- class [CFilterPropertyNet](#)
- class [CFluidControlDeviceNet](#)
  - CFluidControlDeviceNet* is the class to control MCS FluidControl (FCB and FCX) device.
- class [CGenericDevelopDeviceNet](#)
  - CGenericDevelopDeviceNet* is the class to use during development of a new device.
- class [CGilsonDeviceNet](#)
  - CGilsonDeviceNet* is the class to control a Gilson device.
- class [CIntanMea\\_FunctionNet](#)
- class [CMcsBusNet](#)
- class [CMcsBus\\_MotorControlNet](#)
- class [CMcsBus\\_VoltageModeNet](#)
- class [CMcsBus\\_AxisParametersNet](#)
- class [CMcsBus\\_SensorNet](#)
- class [CMcsBus\\_TempSensorNet](#)
- class [CMcsBus\\_ExtensionNet](#)
- class [CMcsBus\\_FYIExtensionNet](#)
- class [CSerialPortNet](#)
- class [usbSetupPacket\\_t](#)
- class [CMcsUsbDeviceStatePushFunctionNet](#)
- class [CMcsUsbDeviceStatePushNet](#)
- class [CMcsUsbFactoryNet](#)
- class [CMcsUsbFunctionPointerContainer](#)
- class [CMcsUsbFunctionNet](#)
- class [CMcsUsbListEntryNet](#)
  - McsUsbListEntryNet* identifies a connected device.
- class [CMcsUsbListNet](#)
  - Class to handle a list of connected MCS USB devices.*
- class [CUsbExceptionNet](#)
  - Exception class that is thrown in case of an USB error.*
- class [FirmwareDestinationNames](#)
- class [DriverVersionNet](#)
  - Class gives firmware versions of the device's firmware destinations.*
- class [CMcsUsbPointerContainer](#)

- class [CMcsUsbNet](#)  
*Base class to handle MCS USB devices. All device classes are derived from this class. Functionality that is provided by all MCS devices is handled by this class.*
- class [DigitalSourceGeneral](#)
- class [DigitalSource](#)
- class [StgStatusNet](#)
- class [CMeaAudioFunctionNet](#)
- class [CMeaDeviceNet](#)  
*Base class for MEA data acquisition devices.*
- class [CMeaUSBDeviceNet](#)  
*Class for data acquisition via ME and MEA USB amplifiers*
- class [CMeaDigitalDataFunctionNet](#)
- class [CMeaFeedbackFunctionNet](#)
- class [CMeaImpedanceDeviceNet](#)
- class [CMeaSwitchDeviceNet](#)  
*The class to control the USB-MEA-Switch.*
- class [CMeFunctionNet](#)
- class [mkfilterNet](#)
- class [CNF\\_GenDeviceNet](#)
- class [COctoPotDeviceNet](#)
- class [COKuvisionStimulatorDeviceNet](#)
- class [CPathIdentDeviceNet](#)
- class [CPeristalticPumpDeviceNet](#)  
*CPeristalticPumpDeviceNet is the class to control a Persistaltic Pump.*
- class [CPgaDeviceNet](#)
- class [CPPCDeviceNet](#)
- class [CPPS\\_DeviceNet](#)
- class [CPPS\\_FunctionNet](#)
- class [CProgramPressureCurveNet](#)  
*CProgramPressureCurveNet is the class to program pressure curves*
- class [CRadioControlledDevicesNet](#)
- class [CRetinaLedDeviceNet](#)
- class [CRobo\\_FYITemp\\_FunctionNet](#)
- class [CRobo\\_FYIPProgram\\_FunctionNet](#)
- class [CRoboDacqNet](#)
- class [CHLADacqNet](#)
- class [CRoboDeviceNet](#)  
*CRoboDeviceNet is the base class for all Robo platform based devices*
- class [CRoboStatorDeviceNet](#)
- class [CRoboocyte2DeviceNet](#)  
*CRoboocyte2DeviceNet is the class to control the MCS Roboocyte2 device*
- class [CRoboInjectDeviceNet](#)  
*CRoboInjectDeviceNet is the to control the MCS RoboInject device*
- class [CHiClampDeviceNet](#)  
*CHiClampDeviceNet is the to control the MCS HiClamp device*
- class [CEncapsulatorDeviceNet](#)  
*CEncapsulatorDeviceNet is the to control the MCS HiClamp device*
- class [CHLADeviceNet](#)  
*CHLADeviceNet is the to control the MCS HLA device*
- class [CPPSDeviceNet](#)  
*CPPS4plus1DeviceNet is the to control the MCS HLA device*
- class [CMeasureTableDeviceNet](#)

- CMeasureTableDeviceNet* is the to control the MCS HLA device
- class [CFYIDeviceNet](#)
  - CFYIDeviceNet* is the class to control the MCS FYI device
- class [CPatchServerDeviceNet](#)
  - CPatchServerDeviceNet* is the class to control the MCS PatchServer device
- class [CTEERMachineDeviceNet](#)
- class [CRoboFluidDeviceNet](#)
- class [CSafeISDeviceNet](#)
- class [CStg200xDownloadNet](#)
  - Main class for the STG download mode This class implements the STG download mode interface.*
- class [CStg200xBasicNet](#)
  - Base class for the Stg200x.*
- class [CStg200xDownloadBasicNet](#)
  - CStg200xDownloadBasicNet* is the base class to control the download mode of the MCS STG device.
- class [CStimulusFunctionNet](#)
- class [CSw2to64DeviceNet](#)
  - The class to control the MCS-USB-Sw2to64 device.*
- class [CTcxDeviceNet](#)
  - Class to control a Temperature Controller (TCX)*
- class [CMcsUsbDacqNet](#)
  - Base class for data acquisition devices.*
- struct [W2100\\_StimulusParametersNet](#)
- class [HeadStageIDType](#)
- class [HeadStageIDTypeState](#)
- class [HeadstageIDTypeObject](#)
- class [BatteryState](#)
- class [CW2100\\_StimulatorFunctionNet](#)
- class [CW2100\\_FunctionNet](#)
- class [CWClassicFunctionNet](#)
- class [CWirelessBaseFunctionNet](#)

## Enumerations

Enumerations of CMOS MEA Groups to detect wether it is an Analog, Digital or Frame Context Group

## Enumerator

AnalogGroup	
DigitalGroup	
FrameContextGroup	

**10.2.1.19 DataModeEnumNet** enum [DataModeEnumNet](#) [strong]

Enumerates the data mode of the device, either 16, 24 or 32 bit, can be signed or unsigned.

## Enumerator

Unsigned_16bit	
Unsigned_24bit	
Unsigned_32bit	
Signed_16bit	
Signed_24bit	
Signed_32bit	

**10.2.1.20 DeviceEnumNet** enum [DeviceEnumNet](#) [strong]

Enumerates the group of MCS devices to connect to.

## Enumerator

MCS_DEVICE_ANY	To connect to any MCS device.
MCS_GENERIC_DEVELOPMENT_DEVICE	Please use this only for MCS internal development.
MCS_DEVICE_USB	To connect to any MCS USB device.
MCS_MCCARD_DEVICE	Connect to an MC_Card.
MCS_STG_DEVICE	Connect to an MCS device with STG capability.
MCS_MC_STIMULUS_DEVICE	Devices which should be accessible from MC_Stimulus.
MCS_MEASUSB_DEVICE	Connect to an MCS MeaUsb device.
MCS_MEA_DEVICE	Connect to an MCS MeaUsb device.
MCS_OCTOPOT_DEVICE	Connect to an MCS Octopot device.
MCS_TERSENS_DEVICE	Connect to an MCS Tersens device.
MCS_PGA_DEVICE	Connect to an MCS PGA device.
MCS_PCX_DEVICE	Connect to an MCS PCX device.
MCS_TCX_DEVICE	Connect to an MCS TCX device.
MCS_FCX_DEVICE	Connect to an MCS FCX device.
MCS_RETINA_LED_DEVICE	Connect to an MCS RetineLed device.
MCS_MEA_SWITCH_DEVICE	Connect to an MCS Mea Switch device.
MCS_MEA_IMPEDANCE_DEVICE	Connect to an MCS Mea Impedance device.
MCS_CHANNELTEST_DEVICE	Connect to an MCS ChannelTest device.
MCS_SW2TO64_DEVICE	Connect to an MCS SW2TO64 device.

## Enumerator

MCS_RETINA_AMS_DONGLE	Connect to an MCS Retina AMS Dongle (Radio device)
MCS_PATHIDENT_DEVICE	Connect to an MCS Pathident device.
MCS_ROBO_DEVICE	Connect to an MCS Robo Platform device.
MCS_ROBOOCYTE2_DEVICE	Connect to an MCS Roboocyte2 device.
MCS_ROBOINJECT_DEVICE	Connect to an MCS RoboInject device.
MCS_HICLAMP_DEVICE	Connect to an MCS HiClamp device.
MCS_PATCHSERVER_DEVICE	Connect to an MCS PatchServer device.
MCS_ENCAPSULATOR_DEVICE	Connect to an MCS Encapsulator device.
MCS_MEASURETABLE_DEVICE	Connect to an MCS Encapsulator device.
MCS_FYI_DEVICE	Connect to an MCS FYI device.
MCS_HLA_DEVICE	Connect to an MCS HLA device.
MCS_PPS_DEVICE	Connect to an MCS PPS device.
MCS_PPS5_DEVICE	Connect to an MCS PPS5 device.
MCS_OKUVISION_STIMULATOR_DEVICE	Connect to an Okuvision Stimulator device.
MCS_NF_GEN_DEVICE	Connect to an MCS NF-Gen device.
MCS_SAFEIS_DEVICE	Connect to an MCS SafeIS device.
MCS_PERISTALTIC_PUMP_DEVICE	Connect to an MCS PeristalticPump device.
MCS_EXTERN_BC_TESTER_DEVICE	Connect to an ExternBCTest device.
MCS_EXTERN_D_TESTER_DEVICE	Connect to an ExternDTester device.
MCS_SOFTWARE_DONGLE_DEVICE	Connect to an Software Dongle device.
MCS_MEA_CLEAN_DEVICE	Connect to a MEA Clean device.
MCS_MEA_COAT_DEVICE	Connect to a MEA Clean device.
MCS_SMARTIMPLANT_DEVICE	Connect to a SmartImplant device.
MCS_MBC08_DEVICE	Connect to a MultiBatteryCharger device.
MCS_PEDOTER_DEVICE	Connect to a Pedoter device.
MCS_PPC_DEVICE	Connect to a PPC device.
WARNER_VALVE_CONTROL_DEVICE	Connect to a Warner Valve Control device.
WARNER_USSING_DEVICE	Connect to a Warner Valve Control device.
HEKA_LIH3_DEVICE	Connect to a HEKA LIH3 device.
ALA_VC3_DEVICE	Connect to an ALA VC3 Valve Commander.
MCS_DEVICE_USB_CYPRESS	Connect to a Cypress USB device.

### 10.2.1.21 DigitalDatastreamEnableEnumNet `enum DigitalDatastreamEnableEnumNet` [strong]

enumerates the streams available as digital datastream

## Enumerator

None	No digital datastream.
Mux	16 bits from the standard MUX datastream.
MuxOtherDevice	The 16 bits of the standard MUX datastream used by the other virtual device.
DigitalInReserverd	The lower 16 bits of the Digital IN port, these ports are on the device by default used as Digital OUT, thus not available as Digital IN.
DigitalIn	The upper 16 bits of the Digital IN port, use when Digital IN datastream is needed.
DigitalOut	The lower 16 bits of the Digital OUT port, use when Digital OUT datastream is needed.

## Enumerator

DigitalOutReserved	The upper 16 bits of the Digital OUT port, these ports are on the device by default used as Digital IN, thus not available as Digital OUT.
RegisterLow	The lower 16 bits of the digital register.
RegisterHigh	The upper 16 bits of the digital register.
FeedbackLow	The lower 16 bits of the realtime feedback register.
FeedbackHigh	The upper 16 bits of the realtime feedback register.
Aux	The 2 bits of the AUX port.
PeriodicPulse	The 8 bits of the Periodic Pulse Generator (Video-Sync).
DigOutStim	The 16 bits of the Digital Out Stimulator.
Hs1Digital	Headstage 1 digital signals.
Hs1Trigger	Headstage 1 trigger signals.
Hs1SidebandLow	Headstage 1 lower 16 bits of sideband data.
Hs1SidebandHigh	Headstage 1 upper 16 bits of sideband data.
Hs2Digital	Headstage 2 digital signals.
Hs2Trigger	Headstage 2 trigger signals.
Hs2SidebandLow	Headstage 2 lower 16 bits of sideband data.
Hs2SidebandHigh	Headstage 2 upper 16 bits of sideband data.

### 10.2.1.22 DigitalSourceEnumNet `enum DigitalSourceEnumNet [strong]`

Enumerates the digital source of the MEA2100 device.

SYNCOUT5	show bit 7 to 15 of syncout channel 5 on the digital outputs
SYNCOUT6	show bit 7 to 15 of syncout channel 6 on the digital outputs
SYNCOUT7	show bit 7 to 15 of syncout channel 7 on the digital outputs
SYNCOUT8	show bit 7 to 15 of syncout channel 8 on the digital outputs

**10.2.1.67 Stg200xSegmentFlagsEnumNet** enum [Stg200xSegmentFlagsEnumNet](#) [strong]

Enumerates Segmentflag options for STG400x devices.

Enumerator

None	No Flags.
UpdateTrigger	Assign all channels to the trigger which number is the given segment number.
DownloadOnly	Only switch the segment for the next download, keep current segment running.
TriggerOnly	Only switch the segment for the next sweep, keep current download segment.
SyncStart	Delay the start the new segment with SendSegmentStart() until the next sweep has finished.

**10.2.1.68 Stg200xTriggerStatusEnumNet** enum [Stg200xTriggerStatusEnumNet](#) [strong]

Enumerates the STG download mode trigger status

The STG maintains the status for each of the STG200x\_NUM\_TRIGGER triggers

Enumerator

Idle	
Running	
Finished	
Armed	

**10.2.1.69 STG\_DestinationEnumNet** enum [STG\\_DestinationEnumNet](#) [strong]

Enumerates the destination for STG downloads.

### 11.11.3 Member Function Documentation

**11.11.3.1 [BurnDacOffset](#)()** void [BurnDacOffset](#) (  
uint16\_t dacChannel )

Writes the offset of a DAC channel to permanent memory.

**Parameters**

<i>dacChannel</i>	The DAC channel number.
-------------------	-------------------------

**11.11.3.2 GetDacOffset()** `int32_t GetDacOffset (`  
     `uint16_t dacChannel )`

Gets the offset of a DAC channel.

**Parameters**

<i>dacChannel</i>	The DAC channel number.
-------------------	-------------------------

**Returns**

The offset in digits.

**11.11.3.3 SetDacOffset()** `void SetDacOffset (`  
     `uint16_t dacChannel,`  
     `int32_t offset )`

Sets the offset of a DAC channel.

**Parameters**

<i>dacChannel</i>	The DAC channel number.
<i>offset</i>	The offset in digits.

### 11.21.1 Detailed Description

[CDigOutStimulatorFunctionNet](#) is the class of the DigOut stimulator function class.

### 11.21.2 Constructor & Destructor Documentation

**11.21.2.1 CDigOutStimulatorFunctionNet()** [1/2] [CDigOutStimulatorFunctionNet](#) (  
    [CMcsUsbNet](#)<sup>^</sup> *mcsusb*,  
    [CMcsUsbFunctionPointerContainer](#)<sup>^</sup> *pDigOutStimulatorFunctionPointerContainer* )

Initializes a new instance of the [CDigOutStimulatorFunctionNet](#) class.

**11.21.2.2 CDigOutStimulatorFunctionNet()** [2/2] [CDigOutStimulatorFunctionNet](#) (  
    [CMcsUsbNet](#)<sup>^</sup> *mcsusb* )

**11.21.2.3 ~CDigOutStimulatorFunctionNet()** virtual [~CDigOutStimulatorFunctionNet](#) ( ) [virtual]

**11.21.2.4 !CDigOutStimulatorFunctionNet()** [!CDigOutStimulatorFunctionNet](#) ( )

### 11.21.3 Member Function Documentation

**11.21.3.1 ClearChannel()** void ClearChannel (  
    int32\_t *NrChannel* )

clear stimulation pattern

#### Parameters

<i>NrChannel</i>	the channel to clear
------------------	----------------------

**11.21.3.2 GetGlobalRepeat()** `bool GetGlobalRepeat (`  
`int32_t NrChannel )`

get repeat whole stimulation pattern

**Parameters**

<i>NrChannel</i>	channel number
------------------	----------------

**Returns**

current value

**11.21.3.3 GetNumberOfChannels()** `int32_t GetNumberOfChannels ( )`

get the number of channels available on the device

**Returns**

the number of channels

**11.21.3.4 GetStartTriggerSlope()** `DigitalStimulatorTriggerSlopeEnumNet GetStartTriggerSlope (`  
`int32_t NrChannel )`

queries start condition of digital out stimulator

**Parameters**

<i>NrChannel</i>	channel number
------------------	----------------

**Returns**

start condition (rising or falling edge)

**11.21.3.5 GetStopTriggerSlope()** `DigitalStimulatorTriggerSlopeEnumNet GetStopTriggerSlope (`  
`int32_t NrChannel )`

queries stop condition of digital out stimulator

**Parameters**

<i>NrChannel</i>	channel number
------------------	----------------

**Returns**

stop condition (rising or falling edge)

**11.21.3.6 PrepareChannelData()** `CStimulusFunctionNet::StimulusDeviceDataAndUnrolledData ^ PrepareChannelData (`  
`array< int32_t >^ Amplitude,`  
`array< uint64_t >^ Duration )`

prepares the channel data for the device and unrolles the data for the GUI

**Parameters**

<i>Amplitude</i>	array of amplitudes
<i>Duration</i>	array of durations

**Returns**

**11.21.3.7 SendChannelData()** `void SendChannelData (`  
`int32_t NrChannel,`  
`CStimulusFunctionNet::StimulusDeviceDataAndUnrolledData^ device_data_and_unrolled`  
`)`

send or append stimulation pattern

**Parameters**

<i>NrChannel</i>	the channel to send data to
<i>device_data_and_unrolled</i>	internal, use value obtained from PrepareChannelData

**11.21.3.8 SetGlobalRepeat()** `void SetGlobalRepeat (`  
`int32_t NrChannel,`  
`bool value )`

set repeat whole stimulation pattern

**Parameters**

<i>NrChannel</i>	channel number
<i>value</i>	new value

**11.21.3.9 SetStartTriggerSlope()** `void SetStartTriggerSlope (`  
    `int32_t NrChannel,`  
    `DigitalStimulatorTriggerSlopeEnumNet Condition )`

sets start condition of digital out stimulator

**Parameters**

<i>NrChannel</i>	channel number
<i>Condition</i>	start condition (rising or falling edge)

**11.21.3.10 SetStopTriggerSlope()** `void SetStopTriggerSlope (`  
    `int32_t NrChannel,`  
    `DigitalStimulatorTriggerSlopeEnumNet Condition )`

sets stop condition of digital out stimulator

**Parameters**

<i>NrChannel</i>	channel number
<i>Condition</i>	stop condition (rising or falling edge)

## 11.22 CEncapsulatorDeviceNet Class Reference

[CEncapsulatorDeviceNet](#) is the to control the MCS HiClamp device

Inheritance diagram for CEncapsulatorDeviceNet:

### Public Member Functions

- [CEncapsulatorDeviceNet](#) (void)
- [CRoboFluidDeviceNet](#) ^ [GetRoboFluidDevice](#) ()

### Additional Inherited Members

#### 11.22.1 Detailed Description

[CEncapsulatorDeviceNet](#) is the to control the MCS HiClamp device

### 11.22.2 Constructor & Destructor Documentation

**11.22.2.1 CEncapsulatorDeviceNet()** `CEncapsulatorDeviceNet ( void )`

### 11.22.3 Member Function Documentation

**11.22.3.1 GetRoboFluidDevice()** `CRoboFluidDeviceNet ^ GetRoboFluidDevice ( )`

## 11.23 CExternDTesterDeviceNet Class Reference

[CExternDTesterDeviceNet](#) is the class to access the ExternD Tester (Handheld Device Tester D)

Inheritance diagram for CExternDTesterDeviceNet:

### Public Member Functions

- [CExternDTesterDeviceNet](#) ()  
*Initializes a new instance of the [CExternDTesterDeviceNet](#) class.*
- virtual [~CExternDTesterDeviceNet](#) ()
- [!CExternDTesterDeviceNet](#) ()
- `array< uint8_t > ^ Read (int configString_Length)`  
*Reads the config string from the device.*
- `String ^ Read2 ()`  
*Reads the config string from the device.*
- void [Write](#) (array< uint8\_t > ^ configString)  
*Reads the config string from the device.*
- void [Write2](#) (String ^ configString)  
*Reads the config string from the device.*

### Additional Inherited Members

#### 11.23.1 Detailed Description

[CExternDTesterDeviceNet](#) is the class to access the ExternD Tester (Handheld Device Tester D)

## 11.23.2 Constructor & Destructor Documentation

### 11.23.2.1 CExternDTesterDeviceNet() `CExternDTesterDeviceNet ( )`

Initializes a new instance of the `CExternDTesterDeviceNet` class.

### 11.23.2.2 ~CExternDTesterDeviceNet() `virtual ~CExternDTesterDeviceNet ( ) [virtual]`

### 11.23.2.3 "!CExternDTesterDeviceNet() `!CExternDTesterDeviceNet ( )`

## 11.23.3 Member Function Documentation

### 11.23.3.1 Read() `array<uint8_t> ^ Read ( int configString_Length )`

Reads the config string from the device.

#### Parameters

<code>configString_Length</code>	The maximal length of configString.
----------------------------------	-------------------------------------

#### Returns

The config string.

### 11.23.3.2 Read2() `String ^ Read2 ( )`

Reads the config string from the device.

#### Returns

The config string.

### 11.23.3.3 Write() `void Write ( array< uint8_t > ^ configString )`

Reads the config string from the device.

## Parameters

<code>configString</code>	The config string.
---------------------------	--------------------

**11.23.3.4 Write2()** `void Write2 (String^ configString )`

Reads the config string from the device.

## Parameters

<code>configString</code>	The config string.
---------------------------	--------------------

## 11.24 CFilterCoefficientsNet Class Reference

## Additional Inherited Members

### 11.28.1 Detailed Description

[CFluidControlDeviceNet](#) is the class to control MCS FluidControl (FCB and FCX) device.

## 11.28.2 Constructor & Destructor Documentation

### 11.28.2.1 CFluidControlDeviceNet() `CFluidControlDeviceNet ( )`

Initialize a new instance of the `CFluidControlDeviceNet` class.

### 11.28.2.2 ~CFluidControlDeviceNet() `~CFluidControlDeviceNet ( )`

Default destructor.

## 11.28.3 Member Function Documentation

### 11.28.3.1 CalibrateThermocouple() `void CalibrateThermocouple ( unsigned int channel )`

Calibrates the ADC which is used for the Thermocouple. For the calibration, Short circuit the Thermocouple and use this function to correct a possible offset of the ADC which measures the thermocouple.

#### Parameters

<i>channel</i>	Thermocouple channel number.
----------------	------------------------------

### 11.28.3.2 GetAdc() `unsigned int GetAdc ( unsigned int channel )`

Reads an ADC Value.

#### Parameters

<i>channel</i>	The ADC channel number to query.
----------------	----------------------------------

#### Returns

The current ADC value.

**11.28.3.3 GetDigin()** `unsigned int GetDigin ( )`

Reads the digital input.

**Returns**

The bit pattern of the state of the digital inputs.

**11.28.3.4 GetDigout()** `unsigned int GetDigout ( )`

Gets the state of the digital output.

**Returns**

The current state of the digital outputs as a bit pattern.

**11.28.3.5 GetPWM()** `unsigned int GetPWM (`  
`unsigned int channel )`

Gets the state of the PWM output.

**Returns**

The current state of the PWM outputs duty cycle in permille.

**11.28.3.6 GetReferenceTemperature()** `int GetReferenceTemperature (`  
`unsigned int channel )`

Reads the reference temperature for the Thermocouple.

**Parameters**

<i>channel</i>	Thermocouple channel number.
----------------	------------------------------

**Returns**

The temperature from the Thermocouple in 1/100 °C.

**11.28.3.7 GetSingleValve()** `unsigned short GetSingleValve (`  
`unsigned short valve )`

Gets the state of a valve.

**Parameters**

<i>valve</i>	number of valve
--------------	-----------------

**Returns**

state of the valve

**11.28.3.8 GetThermocoupleCalibration()** `unsigned int GetThermocoupleCalibration ( unsigned int channel )`

Gets the calibration constant for the Thermocouple ADC.

**Parameters**

<i>channel</i>	Thermocouple channel number.
----------------	------------------------------

**Returns**

The calibration constant for the Thermocouple ADC.

**11.28.3.9 GetThermocoupleNanovoltPerKelvin()** `unsigned int GetThermocoupleNanovoltPerKelvin ( unsigned int channel )`

Reads the proportional constant for the Thermocouple.

**Parameters**

<i>channel</i>	Thermocouple channel number.
----------------	------------------------------

**Returns**

The proportional constant in Nanovolt per Kelvin.

**11.28.3.10 GetThermocoupleTemperature()** `int GetThermocoupleTemperature ( unsigned int channel )`

Reads the temperature from Thermocouple. The functions gives the temperature difference between both Thermocouple junctions. To get the absolute temperature, add the reference temperature.

## Parameters

<i>channel</i>	Thermocouple channel number.
----------------	------------------------------

## Returns

The temperature difference between both Thermocouple junctions in 1/100 °C.

**11.28.3.11 GetValve()** `unsigned int GetValve ( )`

Gets the state of the valves.

## Returns

The current state of the valves as a bit pattern.

**11.28.3.12 SetDigout()** `void SetDigout (`  
`unsigned int value )`

Define the pattern on the Digital Output.

## Parameters

<i>value</i>	bit pattern on the digital output.
--------------	------------------------------------

**11.28.3.13 SetPWM()** `void SetPWM (`  
`unsigned int channel,`  
`unsigned int value )`

Sets the duty cycle of the PWM output.

## Parameters

<i>channel</i>	PWM channel number.
<i>value</i>	duty cycle of the PWM output in permille.

**11.28.3.14 SetSingleValve()** `void SetSingleValve (`  
`unsigned short valve,`  
`unsigned short onoff )`

Opens or Closes a valve.

## Parameters

<i>valve</i>	number of valve to be changed.
--------------	--------------------------------

## Parameters

<i>onoff</i>	open or close the valve.
--------------	--------------------------

**11.28.3.15 SetThermocoupleNanovoltPerKelvin()** `void SetThermocoupleNanovoltPerKelvin ( unsigned int channel, unsigned int value )`

Sets the proportinal constant for the Thermocouple.

## Parameters

<i>channel</i>	Thermocouple channel number.
<i>value</i>	proportinal constant for the Thermocouple in Nanovolt per Kelvin.

**11.28.3.16 SetValve()** `void SetValve ( unsigned int value )`

Open or Close valves.

## Parameters

<i>value</i>	bit pattern of valves which should be open.
--------------	---

## 11.28.4 Property Documentation

**11.28.4.1 McsBus\_VoltageMode** `CMcsBus_VoltageModeNet^ McsBus_VoltageMode [get]`

## 11.30 CGenericDevelopDeviceNet Class Reference

`CGenericDevelopDeviceNet` is the class to use during development of a new device.

Inheritance diagram for `CGenericDevelopDeviceNet`:

### Public Member Functions

- `CGenericDevelopDeviceNet` (void)  
*Initialize a new instance of the `CGenericDevelopDeviceNet` class.*
- `~CGenericDevelopDeviceNet` (void)
- void `SetValue` (uint16\_t value, uint16\_t index)  
*Sets .*

#### Parameters

value	<i>The value of the request.</i>
-------	----------------------------------

#### Parameters

index	<i>The index of the request.</i>
-------	----------------------------------

- template<typename C >  
void `SetBuffer` (uint16\_t value, uint16\_t index, array< C >^ buffer)
- void `SetUByteBuffer` (uint16\_t value, uint16\_t index, array< unsigned char >^ buffer)  
*Sends an array of type unsigned char to the device.*

#### Parameters

value	<i>The value of the request.</i>
-------	----------------------------------

#### Parameters

index	<i>The index of the request.</i>
-------	----------------------------------

*Parameters*

buffer	<i>The buffer to send.</i>
--------	----------------------------

- void [SetByteBuffer](#) (uint16\_t value, uint16\_t Index, array< char >^ buffer)

*Sends an array of type char to the device.*

*Parameters*

value	<i>The value of the request.</i>
-------	----------------------------------

*Parameters*

Index	<i>The index of the request.</i>
-------	----------------------------------

*Parameters*

buffer	<i>The buffer to send.</i>
--------	----------------------------

- void [SetUShortBuffer](#) (uint16\_t value, uint16\_t index, array< unsigned short >^ buffer)

*Sends an array of type unsigned short to the device.*

*Parameters*

value	<i>The value of the request.</i>
-------	----------------------------------

*Parameters*

index	<i>The index of the request.</i>
-------	----------------------------------

*Parameters*

buffer	<i>The buffer to send.</i>
--------	----------------------------

- void [SetShortBuffer](#) (uint16\_t value, uint16\_t index, array< short >^ buffer)

*Sends an array of type short to the device.*

*Parameters*

value	<i>The value of the request.</i>
-------	----------------------------------

*Parameters*

index	<i>The index of the request.</i>
-------	----------------------------------

*Parameters*

buffer	<i>The buffer to send.</i>
--------	----------------------------

- void [SetUIntBuffer](#) (uint16\_t value, uint16\_t index, array< unsigned int >^ buffer)  
*Sends an array of unsigned int to the device.*

*Parameters*

value	<i>The value of the request.</i>
-------	----------------------------------

*Parameters*

index	<i>The index of the request.</i>
-------	----------------------------------

*Parameters*

buffer	<i>The buffer to send.</i>
--------	----------------------------

- void [SetIntBuffer](#) (uint16\_t value, uint16\_t index, array< int >^ buffer)  
*Sends an array of type int to the device.*

*Parameters*

value	<i>The value of the request.</i>
-------	----------------------------------

*Parameters*

index	<i>The index of the request.</i>
-------	----------------------------------

*Parameters*

buffer	<i>The buffer to send.</i>
--------	----------------------------

- `template<typename C >`  
`array< C > ^ GetBuffer (uint16_t value, uint16_t index, int size)`
- `array< unsigned char > ^ GetUByteBuffer (uint16_t value, uint16_t index, int size)`  
*Gets an array of type unsigned char from the device.*

**Parameters**

value	<i>The value of the request.</i>
-------	----------------------------------

**Parameters**

index	<i>The index of the request.</i>
-------	----------------------------------

**Parameters**

size	<i>The size of the array.</i>
------	-------------------------------

**Returns**

*The array of data from the device.*

- `array< char > ^ GetByteBuffer (uint16_t value, uint16_t index, int size)`  
*Gets an array of type char from the device.*

**Parameters**

value	<i>The value of the request.</i>
-------	----------------------------------

**Parameters**

index	<i>The index of the request.</i>
-------	----------------------------------

**Parameters**

size	<i>The size of the array.</i>
------	-------------------------------

**Returns**

*The array of data from the device.*

- `array< unsigned short > ^ GetUShortBuffer (uint16_t value, uint16_t index, int size)`  
*Gets an array of type unsigned short from the device.*

*Parameters*

value	<i>The value of the request.</i>
-------	----------------------------------

*Parameters*

index	<i>The index of the request.</i>
-------	----------------------------------

*Parameters*

size	<i>The size of the array.</i>
------	-------------------------------

*Returns*

*The array of data from the device.*

- array< short > ^ [GetShortBuffer](#) (uint16\_t value, uint16\_t index, int size)

*Gets an array of type short from the device.*

*Parameters*

value	<i>The value of the request.</i>
-------	----------------------------------

*Parameters*

index	<i>The index of the request.</i>
-------	----------------------------------

*Parameters*

size	<i>The size of the array.</i>
------	-------------------------------

*Returns*

*The array of data from the device.*

- array< unsigned int > ^ [GetUIntBuffer](#) (uint16\_t value, uint16\_t index, int size)

*Gets an array of type unsigned int from the device.*

*Parameters*

value	<i>The value of the request.</i>
-------	----------------------------------

**Parameters**

index	<i>The index of the request.</i>
-------	----------------------------------

**Parameters**

size	<i>The size of the array.</i>
------	-------------------------------

**Returns**

*The array of data from the device.*

- `array< int > ^ GetIntBuffer (uint16_t value, uint16_t index, int size)`

*Gets an array of type int from the device.*

**Parameters**

value	<i>The value of the request.</i>
-------	----------------------------------

**Parameters**

index	<i>The index of the request.</i>
-------	----------------------------------

**Parameters**

size	<i>The size of the array.</i>
------	-------------------------------

**Returns**

*The array of data from the device.*

- `template<typename C > void VendorOutRequest (uint8_t request, uint16_t value, uint16_t index, array< C >^ buffer)`
- `template<typename C > array< C > ^ VendorInRequest (uint8_t request, uint16_t value, uint16_t index, int size)`
- `IntPtr OpenPipe (uint8_t endpointAddress)`

*Open a Pipe to an USB Endpoint.*

**Parameters**

endpointAddress	<i>The Endpoint Number.</i>
-----------------	-----------------------------

**Returns**

*A handle to the endpoint.*

- `void ClosePipe (IntPtr pipeHandle)`

*Close a Pipe to an USB Endpoint.*

*Parameters*

pipeHandle	<i>The endpoint handle.</i>
------------	-----------------------------

- void [ResetPipe](#) (IntPtr pipeHandle)  
*Reset a Pipe to an USB Endpoint.*

*Parameters*

pipeHandle	<i>The endpoint handle.</i>
------------	-----------------------------

- template<typename C >  
array< C > ^ [ReadPipe](#) (IntPtr pipeHandle, uint32\_t size)  
*Read data from an USB Endpoint.*

*Parameters*

pipeHandle	<i>The endpoint handle.</i>
------------	-----------------------------

*Parameters*

size	<i>Number of elements to read.</i>
------	------------------------------------

*Returns*

*An array of data read.*

- template<typename C >  
void [WritePipe](#) (IntPtr pipeHandle, array< C >^ buffer)  
*Write data to an USB Endpoint.*

*Parameters*

pipeHandle	<i>The endpoint handle.</i>
------------	-----------------------------

*Parameters*

buffer	<i>An array of data to write.</i>
--------	-----------------------------------

**Additional Inherited Members****11.30.1 Detailed Description**

[CGenericDevelopDeviceNet](#) is the class to use during development of a new device.

### 11.30.2 Constructor & Destructor Documentation

**11.30.2.1 CGenericDevelopDeviceNet()** `CGenericDevelopDeviceNet ( void )`

Initialize a new instance of the `CGenericDevelopDeviceNet` class.

**11.30.2.2 ~CGenericDevelopDeviceNet()** `~CGenericDevelopDeviceNet ( void )`

### 11.30.3 Member Function Documentation

**11.30.3.1 ClosePipe()** `void ClosePipe ( IntPtr pipeHandle )`

Close a Pipe to an USB Endpoint.

#### Parameters

<i>pipeHandle</i>	The endpoint handle.
-------------------	----------------------

**11.30.3.2 GetBuffer()** `array<C> ^ GetBuffer ( uint16_t value, uint16_t index, int size )`

**11.30.3.3 GetByteBuffer()** `array<char> ^ GetByteBuffer ( uint16_t value, uint16_t index, int size )`

Gets an array of type char from the device.

## Parameters

<i>value</i>	The value of the request.
--------------	---------------------------

## Parameters

<i>index</i>	The index of the request.
--------------	---------------------------

## Parameters

<i>size</i>	The size of the array.
-------------	------------------------

## Returns

The array of data from the device.

**11.30.3.4 GetIntBuffer()** `array<int> ^ GetIntBuffer (`  
    `uint16_t value,`  
    `uint16_t index,`  
    `int size )`

Gets an array of type int from the device.

## Parameters

<i>value</i>	The value of the request.
--------------	---------------------------

## Parameters

<i>index</i>	The index of the request.
--------------	---------------------------

**Parameters**

<i>size</i>	The size of the array.
-------------	------------------------

**Returns**

The array of data from the device.

**11.30.3.5 GetShortBuffer()** `array<short> ^ GetShortBuffer (`  
    `uint16_t value,`  
    `uint16_t index,`  
    `int size )`

Gets an array of type short from the device.

**Parameters**

<i>value</i>	The value of the request.
--------------	---------------------------

**Parameters**

<i>index</i>	The index of the request.
--------------	---------------------------

**Parameters**

<i>size</i>	The size of the array.
-------------	------------------------

**Returns**

The array of data from the device.

**11.30.3.6 GetUByteBuffer()** `array<unsigned char> ^ GetUByteBuffer (`  
    `uint16_t value,`  
    `uint16_t index,`  
    `int size )`

Gets an array of type unsigned char from the device.

**Parameters**

<i>value</i>	The value of the request.
--------------	---------------------------

**Parameters**

<i>index</i>	The index of the request.
--------------	---------------------------

**Parameters**

<i>size</i>	The size of the array.
-------------	------------------------

**Returns**

The array of data from the device.

**11.30.3.7 GetUIntBuffer()** `array<unsigned int> ^ GetUIntBuffer (`  
    `uint16_t value,`  
    `uint16_t index,`  
    `int size )`

Gets an array of type unsigned int from the device.

**Parameters**

<i>value</i>	The value of the request.
--------------	---------------------------

**Parameters**

<i>index</i>	The index of the request.
--------------	---------------------------

**Parameters**

<i>size</i>	The size of the array.
-------------	------------------------

**Returns**

The array of data from the device.

**11.30.3.8 GetUShortBuffer()** `array<unsigned short> ^ GetUShortBuffer (`  
    `uint16_t value,`  
    `uint16_t index,`  
    `int size )`

Gets an array of type unsigned short from the device.

**Parameters**

<i>value</i>	The value of the request.
--------------	---------------------------

**Parameters**

<i>index</i>	The index of the request.
--------------	---------------------------

**Parameters**

<i>size</i>	The size of the array.
-------------	------------------------

**Returns**

The array of data from the device.

**11.30.3.9 OpenPipe()** `IntPtr OpenPipe (`  
    `uint8_t endpointAddress )`

Open a Pipe to an USB Endpoint.

**Parameters**

<i>endpointAddress</i>	The Endpoint Number.
------------------------	----------------------

**Returns**

A handle to the endpoint.

**11.30.3.10 ReadPipe()** `array<C> ^ ReadPipe (`  
    `IntPtr pipeHandle,`  
    `uint32_t size )`

Read data from an USB Endpoint.

**Parameters**

<i>pipeHandle</i>	The endpoint handle.
-------------------	----------------------

**Parameters**

<i>size</i>	Number of elements to read.
-------------	-----------------------------

**Returns**

An array of data read.

**11.30.3.11 ResetPipe()** `void ResetPipe (`  
    `IntPtr pipeHandle )`

Reset a Pipe to an USB Endpoint.

**Parameters**

<i>pipeHandle</i>	The endpoint handle.
-------------------	----------------------

**11.30.3.12 SetBuffer()** `void SetBuffer (`  
    `uint16_t value,`  
    `uint16_t index,`  
    `array< C >^ buffer )`

**11.30.3.13 SetByteBuffer()** `void SetByteBuffer (`  
    `uint16_t value,`  
    `uint16_t Index,`  
    `array< char >^ buffer )`

Sends an array of type char to the device.

**Parameters**

<i>value</i>	The value of the request.
--------------	---------------------------

**Parameters**

<i>Index</i>	The index of the request.
--------------	---------------------------

**Parameters**

<i>buffer</i>	The buffer to send.
---------------	---------------------

**11.30.3.14 SetIntBuffer()** `void SetIntBuffer (`  
    `uint16_t value,`  
    `uint16_t index,`  
    `array< int >^ buffer )`

Sends an array of type int to the device.

**Parameters**

<i>value</i>	The value of the request.
--------------	---------------------------

**Parameters**

<i>index</i>	The index of the request.
--------------	---------------------------

**Parameters**

<i>buffer</i>	The buffer to send.
---------------	---------------------

**11.30.3.15 SetShortBuffer()** `void SetShortBuffer (`  
    `uint16_t value,`  
    `uint16_t index,`  
    `array< short >^ buffer )`

Sends an array of type short to the device.

**Parameters**

<i>value</i>	The value of the request.
--------------	---------------------------

**Parameters**

<i>index</i>	The index of the request.
--------------	---------------------------

**Parameters**

<i>buffer</i>	The buffer to send.
---------------	---------------------

**11.30.3.16 SetUByteBuffer()** `void SetUByteBuffer (`  
    `uint16_t value,`

```
uint16_t index,  
array< unsigned char >^ buffer )
```

Sends an array of type unsigned char to the device.

#### Parameters

<i>value</i>	The value of the request.
--------------	---------------------------

#### Parameters

<i>index</i>	The index of the request.
--------------	---------------------------

#### Parameters

<i>buffer</i>	The buffer to send.
---------------	---------------------

**11.30.3.17 SetUIntBuffer()** void SetUIntBuffer (  
uint16\_t value,  
uint16\_t index,  
array< unsigned int >^ buffer )

Sends an array of unsigned int to the device.

#### Parameters

<i>value</i>	The value of the request.
--------------	---------------------------

#### Parameters

<i>index</i>	The index of the request.
--------------	---------------------------

**Parameters**

<i>buffer</i>	The buffer to send.
---------------	---------------------

**11.30.3.18 SetUShortBuffer()** `void SetUShortBuffer (`  
    `uint16_t value,`  
    `uint16_t index,`  
    `array< unsigned short >^ buffer )`

Sends an array of type unsigned short to the device.

**Parameters**

<i>value</i>	The value of the request.
--------------	---------------------------

**Parameters**

<i>index</i>	The index of the request.
--------------	---------------------------

**Parameters**

<i>buffer</i>	The buffer to send.
---------------	---------------------

**11.30.3.19 SetValue()** `void SetValue (`  
    `uint16_t value,`  
    `uint16_t index )`

Sets .

**Parameters**

<i>value</i>	The value of the request.
--------------	---------------------------

## Parameters

<i>index</i>	The index of the request.
--------------	---------------------------

**11.30.3.20 VendorInRequest()** `array<C> ^ VendorInRequest (`  
     `uint8_t request,`  
     `uint16_t value,`  
     `uint16_t index,`  
     `int size )`

**11.30.3.21 VendorOutRequest()** `void VendorOutRequest (`  
     `uint8_t request,`  
     `uint16_t value,`  
     `uint16_t index,`  
     `array< C >^ buffer )`

**11.30.3.22 WritePipe()** `void WritePipe (`  
     `IntPtr pipeHandle,`  
     `array< C >^ buffer )`

Write data to an USB Endpoint.

## Parameters

<i>pipeHandle</i>	The endpoint handle.
-------------------	----------------------

## Parameters

<i>buffer</i>	An array of data to write.
---------------	----------------------------

## Additional Inherited Members

### 11.32.1 Detailed Description

[CGrapheneFunctionNet](#) is the class to control Graphene device functions

### 11.32.2 Constructor & Destructor Documentation

**11.32.2.1 CGrapheneFunctionNet()** [1/2] [CGrapheneFunctionNet](#) (  
[CMcsUsbNet](#)<sup>^</sup> mcsusb,  
[CMcsUsbFunctionPointerContainer](#)<sup>^</sup> pGrapheneFunctionPointerContainer )

Initializes a new instance of the [CGrapheneFunctionNet](#) class.

**11.32.2.2 CGrapheneFunctionNet()** [2/2] `CGrapheneFunctionNet (   
CMcsUsbNet^ mcsusb )`

**11.32.2.3 ~CGrapheneFunctionNet()** `virtual ~CGrapheneFunctionNet ( ) [virtual]`

**11.32.2.4 "!CGrapheneFunctionNet()** `!CGrapheneFunctionNet ( )`

### 11.32.3 Member Function Documentation

**11.32.3.1 GetCur2VolResistance()** [1/2] `int32_t GetCur2VolResistance ( )`

Gets the resistance of the current to voltage converter

#### Returns

The resistance in Ohm

**11.32.3.2 GetCur2VolResistance()** [2/2] `int32_t GetCur2VolResistance (   
uint32_t Headstage )`

Gets the resistance of the current to voltage converter

#### Parameters

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

#### Returns

The resistance in Ohm

**11.32.3.3 GetDACOffset()** [1/2] `void GetDACOffset (   
[System::Runtime::InteropServices::Out] int16_t% offset_vd,   
[System::Runtime::InteropServices::Out] int16_t% offset_vs )`

Gets the DAC offset

## Parameters

<i>offset_vd</i>	Vd offset in DAC Units
<i>offset_vs</i>	Vs offset in DAC Units

**11.32.3.4 GetDACOffset()** [2/2] void GetDACOffset (   
uint32\_t *Headstage*,   
[System::Runtime::InteropServices::Out] int16\_t% *offset\_vd*,   
[System::Runtime::InteropServices::Out] int16\_t% *offset\_vs* )

Gets the DAC offset

## Parameters

<i>Headstage</i>	The headstage to query.
<i>offset_vd</i>	Vd offset in DAC Units
<i>offset_vs</i>	Vs offset in DAC Units

**11.32.3.5 GetVds()** [1/2] int32\_t GetVds ( )

Gets Vds

## Returns

Vds in  $\mu\text{V}$

**11.32.3.6 GetVds()** [2/2] int32\_t GetVds (   
uint32\_t *Headstage* )

Gets Vds

## Parameters

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

## Returns

Vds in  $\mu\text{V}$

**11.32.3.7 GetVdVs()** [1/2] `void GetVdVs (`  
    [System::Runtime::InteropServices::Out] `int32_t% Vd,`  
    [System::Runtime::InteropServices::Out] `int32_t% Vs )`

Gets Vd and Vs

Parameters

<i>Vd</i>	Vd in $\mu\text{V}$
<i>Vs</i>	Vs in $\mu\text{V}$

**11.32.3.8 GetVdVs()** [2/2] `void GetVdVs (`  
    `uint32_t Headstage,`  
    [System::Runtime::InteropServices::Out] `int32_t% Vd,`  
    [System::Runtime::InteropServices::Out] `int32_t% Vs )`

Gets Vd and Vs

Parameters

<i>Headstage</i>	The headstage to query.
<i>Vd</i>	Vd in $\mu\text{V}$
<i>Vs</i>	Vs in $\mu\text{V}$

**11.32.3.9 GetVdVsDAC()** [1/2] `void GetVdVsDAC (`  
    [System::Runtime::InteropServices::Out] `int16_t% Vd,`  
    [System::Runtime::InteropServices::Out] `int16_t% Vs )`

Gets Vd and Vs

Parameters

<i>Vd</i>	Vd in DAC Units
<i>Vs</i>	Vs in DAC Units

**11.32.3.10 GetVdVsDAC()** [2/2] `void GetVdVsDAC (`  
    `uint32_t Headstage,`  
    [System::Runtime::InteropServices::Out] `int16_t% Vd,`  
    [System::Runtime::InteropServices::Out] `int16_t% Vs )`

Gets Vd and Vs

## Parameters

<i>Headstage</i>	The headstage to query.
<i>Vd</i>	Vd in DAC Units
<i>Vs</i>	Vs in DAC Units

**11.32.3.11 GetVgs()** [1/2] `int32_t GetVgs ( )`

Gets Vgs

## Returns

Vgs in  $\mu\text{V}$

**11.32.3.12 GetVgs()** [2/2] `int32_t GetVgs (   
uint32_t Headstage )`

Gets Vgs

## Parameters

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

## Returns

Vgs in  $\mu\text{V}$

**11.32.3.13 GetVoltageRange()** [1/2] `int32_t GetVoltageRange ( )`

Gets the voltage range

## Returns

The voltage range in mV

**11.32.3.14 GetVoltageRange()** [2/2] `int32_t GetVoltageRange (   
uint32_t Headstage )`

Gets the voltage range

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The voltage range in mV

**11.32.3.15 GetVoltageReached() [1/2]** `bool GetVoltageReached ( )`

Gets the reached voltage

**Returns**

the reached voltage

**11.32.3.16 GetVoltageReached() [2/2]** `bool GetVoltageReached (   
uint32_t Headstage )`

Gets the reached voltage

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The reached voltage

**11.32.3.17 GetVoltageResolution() [1/2]** `int32_t GetVoltageResolution ( )`

Gets the voltage resolution

**Returns**

The voltage resolution in  $\mu\text{V}/\text{digit}$

**11.32.3.18 GetVoltageResolution() [2/2]** `int32_t GetVoltageResolution (   
uint32_t Headstage )`

Gets the voltage resolution

## Parameters

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

## Returns

The voltage resolution in  $\mu\text{V}/\text{digit}$

**11.32.3.19 SetDACOffset() [1/2]** `void SetDACOffset (`  
`int16_t offset_vd,`  
`int16_t offset_vs )`

Sets the DAC offset

## Parameters

<i>offset_vd</i>	Vd offset in DAC Units
<i>offset_vs</i>	Vs offset in DAC Units

**11.32.3.20 SetDACOffset() [2/2]** `void SetDACOffset (`  
`uint32_t Headstage,`  
`int16_t offset_vd,`  
`int16_t offset_vs )`

Set the DAC offset

## Parameters

<i>Headstage</i>	The headstage to query.
<i>offset_vd</i>	Vd offset in DAC Units
<i>offset_vs</i>	Vs offset in DAC Units

**11.32.3.21 SetVds() [1/2]** `void SetVds (`  
`int32_t Vds )`

Sets Vds

## Parameters

<i>Vds</i>	Vds in $\mu\text{V}$
------------	----------------------

**11.32.3.22 SetVds()** [2/2] `void SetVds (`  
    `uint32_t Headstage,`  
    `int32_t Vds )`

Sets Vds

Parameters

<i>Headstage</i>	The headstage to query.
<i>Vds</i>	Vds in $\mu\text{V}$

**11.32.3.23 SetVdVs()** [1/2] `void SetVdVs (`  
    `int32_t Vd,`  
    `int32_t Vs )`

Sets Vd and Vs

Parameters

<i>Vd</i>	Vd in $\mu\text{V}$
<i>Vs</i>	Vs in $\mu\text{V}$

**11.32.3.24 SetVdVs()** [2/2] `void SetVdVs (`  
    `uint32_t Headstage,`  
    `int32_t Vd,`  
    `int32_t Vs )`

Sets Vd and Vs

Parameters

<i>Headstage</i>	The headstage to query.
<i>Vd</i>	Vd in $\mu\text{V}$
<i>Vs</i>	Vs in $\mu\text{V}$

**11.32.3.25 SetVdVsDAC()** [1/2] `void SetVdVsDAC (`  
    `int16_t Vd,`  
    `int16_t Vs )`

Sets Vd and Vs

Parameters

<i>Vd</i>	Vd in DAC Units
<i>Vs</i>	Vs in DAC Units

**11.32.3.26 SetVdVsDAC()** [2/2] void SetVdVsDAC (  
    uint32\_t *Headstage*,  
    int16\_t *Vd*,  
    int16\_t *Vs* )

Sets Vd and VS

Parameters

<i>Headstage</i>	The headstage to query.
<i>Vd</i>	Vd in DAC Units
<i>Vs</i>	Vs in DAC Units

**11.32.3.27 SetVgs()** [1/2] void SetVgs (  
    int32\_t *Vgs* )

Sets Vgs

Parameters

<i>Vgs</i>	Vgs in $\mu\text{V}$
------------	----------------------

**11.32.3.28 SetVgs()** [2/2] void SetVgs (  
    uint32\_t *Headstage*,  
    int32\_t *Vgs* )

Sets Vgs

Parameters

<i>Headstage</i>	The headstage to query.
<i>Vgs</i>	Vgs in $\mu\text{V}$

**11.32.3.29 SetVoltageRange()** [1/2] void SetVoltageRange (  
    int32\_t *range* )

Sets the voltage range

Parameters

<i>range</i>	The voltage range in mV
--------------	-------------------------

**11.32.3.30 SetVoltageRange()** [2/2] `void SetVoltageRange (`  
    `uint32_t Headstage,`  
    `int32_t range )`

Sets the voltage range

Parameters

<i>Headstage</i>	The headstage to query.
<i>range</i>	The voltage range in mV

**11.32.3.31 SetVoltageResolution()** [1/2] `void SetVoltageResolution (`  
    `int32_t resolution )`

Sets the voltage resolution

Parameters

<i>resolution</i>	The voltage resolution in $\mu\text{V}/\text{digit}$
-------------------	--

**11.32.3.32 SetVoltageResolution()** [2/2] `void SetVoltageResolution (`  
    `uint32_t Headstage,`  
    `int32_t resolution )`

Sets the voltage resolution

Parameters

<i>Headstage</i>	The headstage to query.
<i>resolution</i>	The voltage resolution in $\mu\text{V}/\text{digit}$

## 11.33 CHiClampDeviceNet Class Reference

[CHiClampDeviceNet](#) is the to control the MCS HiClamp device

## 11.36 CMcsUsbDacqNet::CHWInfo Class Reference

Class to provide hardware information about the device.

### Classes

- class [CVoltageRangeInfoNet](#)

### Public Member Functions

- [CHWInfo](#) ([CMcsUsbDacqNet](#)^ device)
- virtual uint32\_t [GetNumberOfHWADCCChannels](#) ([System::Runtime::InteropServices::Out]int% numberOfChannels)  
*Get the number of analog channels the device supports.*
- virtual uint32\_t [GetNumberOfHWDigitalChannels](#) ([System::Runtime::InteropServices::Out]int% numberOfChannels)  
*Get the number of digital channels the device supports.*
- virtual bool [IsDigitalChannelDedicated](#) ()  
*Query if the digital channel replaces an analog channel when enabled (e.g. on MC\_Card) or adds a channel link on USB devices.*
- virtual uint32\_t [GetAvailableSampleRates](#) ([System::Runtime::InteropServices::Out]System::Collections::Generic::List< int32\_t >^% sampleRates)
- virtual System::Collections::Generic::List< int32\_t > ^ [GetAvailableVoltageRangesInMicroVolt](#) (int milliGain)  
*Gets a List of voltage ranges the device supports.*
- virtual System::Collections::Generic::List< [CVoltageRangeInfoNet](#)^ > ^ [GetAvailableVoltageRangesInMicroVoltAndStringsInMicroVolt](#) (int milliGain)  
*Gets a List of voltage ranges the device supports.*

### 11.36.1 Detailed Description

Class to provide hardware information about the device.

## 11.36.2 Constructor & Destructor Documentation

**11.36.2.1 CHWInfo()** `CHWInfo ( CMcsUsbDacqNet^ device )`

## 11.36.3 Member Function Documentation

**11.36.3.1 GetAvailableSampleRates()** `virtual uint32_t GetAvailableSampleRates ( [System::Runtime::InteropServices::Out] System::Collections::Generic::List< int32_t> ^ sampleRates ) [virtual]`

**11.36.3.2 GetAvailableVoltageRangesInMicroVolt()** `virtual System::Collections::Generic::List<int32_t> ^ GetAvailableVoltageRangesInMicroVolt ( int milliGain ) [virtual]`

Gets a List of voltage ranges the device supports.

The List is scaled by the gain factor given as argument to this function. Use "1000" as scale factor for backwards compatibility. To get a list of voltage ranges for the headstage, obtain the gain of the headstage with the `GetGain()` call and use the result in the `milliGain` parameter. To get a list of voltage ranges for the analog inputs of the interfaceboard, obtain the gain of the analog inputs with the `GetAnalogGain()` call and use the result in the `milliGain` parameter.

### Parameters

<i>milliGain</i>	The gain factor (in milliGain) used to scale the list of voltage ranges.
------------------	--

### Returns

List of voltage ranges in  $\mu\text{V}$ .

**11.36.3.3 GetAvailableVoltageRangesInMicroVoltAndStringsInMilliVolt()** `virtual System::Collections::Generic::List<CVoltageRangeInfoNet^> ^ GetAvailableVoltageRangesInMicroVoltAndStringsInMilliVolt ( int milliGain ) [virtual]`

Gets a List of voltage ranges the device supports.

The List is scaled by the gain factor given as argument to this function. Use "1000" as scale factor for backwards compatibility. Each list entry contains the voltage range as an integer and as a string. To get a list of voltage ranges for the headstage, obtain the gain of the headstage with the `GetGain()` call and use the result in the `milliGain` parameter. To get a list of voltage ranges for the analog inputs of the interfaceboard, obtain the gain of the analog inputs with the `GetAnalogGain()` call and use the result in the `milliGain` parameter.

**Parameters**

<i>milliGain</i>	The gain factor (in milliGain) used to scale the list of voltage ranges.
------------------	--

**Returns**

List of voltage ranges in  $\mu\text{V}$ .

**11.36.3.4 GetNumberOfHWADCCannels()** `virtual uint32_t GetNumberOfHWADCCannels ( [System::Runtime::InteropServices::Out] int% numberOfChannels ) [virtual]`

Get the number of analog channels the device supports.

**Parameters**

<i>numberOfChannels</i>	Number of analog channels the device supports.
-------------------------	--

**Returns**

Error Status. 0 on success.

**11.36.3.5 GetNumberOfHWDigitalChannels()** `virtual uint32_t GetNumberOfHWDigitalChannels ( [System::Runtime::InteropServices::Out] int% numberOfChannels ) [virtual]`

Get the number of digital channels the device supports.

**Parameters**

<i>numberOfChannels</i>	Number of digital channels the device supports.
-------------------------	---

**Returns**

Error Status. 0 on success.

### 11.36.3.6 IsDigitalChannelDedicated() `virtual bool IsDigitalChannelDedicated ( ) [virtual]`

Query if the digital channel replaces an analog channel when enabled (e.g. on MC\_Card) or adds a channel link on USB devices.

#### Returns

false when the digital channel replaces an analog channel when enabled, true when the digital channels is appended to the analog channels when enabled.

*Gets the I/O Voltage level for the IFB2 digital and AUX ports, default is 3.3V.*

### Additional Inherited Members

#### 11.38.1 Detailed Description

[CInterfaceboard2FunctionNet](#) is the class to control the Interfaceboard

## 11.38.2 Constructor & Destructor Documentation

**11.38.2.1 CInterfaceboard2FunctionNet()** [1/2] `CInterfaceboard2FunctionNet ( CMcsUsbNet^ mcsusb, CMcsUsbFunctionPointerContainer^ pInterfaceboard2FunctionPointerContainer )`

Initializes a new instance of the `CInterfaceboard2FunctionNet` class.

**11.38.2.2 CInterfaceboard2FunctionNet()** [2/2] `CInterfaceboard2FunctionNet ( CMcsUsbNet^ mcsusb )`

**11.38.2.3 ~CInterfaceboard2FunctionNet()** `virtual ~CInterfaceboard2FunctionNet ( ) [virtual]`

**11.38.2.4 !CInterfaceboard2FunctionNet()** `!CInterfaceboard2FunctionNet ( )`

## 11.38.3 Member Function Documentation

**11.38.3.1 GetIoVoltage()** `IoVoltageEnumNet GetIoVoltage ( )`

Gets the I/O Voltage level for the IFB2 digital and AUX ports, default is 3.3V.

### Returns

Enum for the IO Voltage (3.3V or 5.0V).

**11.38.3.2 SetIoVoltage()** `void SetIoVoltage ( IoVoltageEnumNet ioVoltage )`

Sets the I/O Voltage level for the IFB2 digital and AUX ports, default is 3.3V.

### Parameters

<i>ioVoltage</i>	Enum for the I/O Voltage (3.3V or 5.0V).
------------------	--

## 11.39 CInterfaceboardFunctionNet Class Reference

[CInterfaceboardFunctionNet](#) is the class to control the Interfaceboard

Inheritance diagram for CInterfaceboardFunctionNet:

### Public Member Functions

- [CInterfaceboardFunctionNet](#) ([CMcsUsbNet](#)<sup>^</sup> mcsusb, [CMcsUsbFunctionPointerContainer](#)<sup>^</sup> pInterfaceboard↔  
FunctionPointerContainer)  
*Initializes a new instance of the [CInterfaceboardFunctionNet](#) class.*

### 11.39.3 Member Function Documentation

**11.39.3.1 GetCardinalDacqSamplerate()** `uint32_t GetCardinalDacqSamplerate ( )`

Gets the fundamental/cardinal data acquisition samplerate of the Interfaceboard, default is 50 kHz

#### Returns

The samplerate in Hz.

**11.39.3.2 GetCardinalStgOutputrate()** `uint32_t GetCardinalStgOutputrate ( )`

Gets the fundamental/cardinal STG output rate of the Interfaceboard, default is 50 kHz

#### Returns

The output rate in Hz.

**11.39.3.3 SetCardinalDacqSamplerate()** `void SetCardinalDacqSamplerate ( uint32_t samplerate )`

Sets the fundamental/cardinal data acquisition samplerate of the Interfaceboard, default is 50 kHz

#### Parameters

<i>samplerate</i>	The samplerate in Hz.
-------------------	-----------------------

**11.39.3.4 SetCardinalStgOutputrate()** `void SetCardinalStgOutputrate (`  
`uint32_t outputrate )`

Sets the fundamental/cardinal STG output rate of the Interfaceboard, default is 50 kHz

#### Parameters

<i>outputrate</i>	The output rate in Hz.
-------------------	------------------------

## 11.40 CLIH3DeviceNet Class Reference

[CLIH3DeviceNet](#) is the class to access the HEKA LIH3 device.

### 11.40.1 Detailed Description

[CLIH3DeviceNet](#) is the class to access the HEKA LIH3 device.

### 11.40.2 Constructor & Destructor Documentation

#### 11.40.2.1 [CLIH3DeviceNet\(\)](#) [CLIH3DeviceNet](#) ( )

Initializes a new instance of the [CLIH3DeviceNet](#) class.

#### 11.40.2.2 [~CLIH3DeviceNet\(\)](#) `virtual ~CLIH3DeviceNet ( ) [virtual]`

#### 11.40.2.3 ["!CLIH3DeviceNet\(\)](#) `!CLIH3DeviceNet ( )`

### 11.40.3 Member Function Documentation

#### 11.40.3.1 [DummyCommand\(\)](#) `void DummyCommand ( uint32_t dummyParameter )`

Dummy command to show how to use the DLL.

##### Parameters

<i>dummyParameter</i>	parameter to send to the device
-----------------------	---------------------------------

#### 11.40.3.2 [EnableUserTrigger\(\)](#) `void EnableUserTrigger ( bool enable )`

Enables the User Trigger

##### Parameters

<i>enable</i>	Enable
---------------	--------

**11.40.3.3 ErasePermanentAdcOffset()** `void ErasePermanentAdcOffset (   
 LIH30\_ADC\_Channel\_EnumNet AdcChannel )`

Deletes the ADC offset of the DACQ for a single channel in permanent EEPROM memory

Parameters

<i>AdcChannel</i>	The ADC channel
-------------------	-----------------

**11.40.3.4 ErasePermanentDacOffset()** `void ErasePermanentDacOffset (   
 LIH30\_DAC\_Channel\_EnumNet DacChannel )`

Deletes the DAC offset of the STG for a single channel in permanent EEPROM memory

Parameters

<i>DacChannel</i>	The DAC channel
-------------------	-----------------

**11.40.3.5 GetAdcOffset()** `int32_t GetAdcOffset (   
 LIH30\_ADC\_Channel\_EnumNet AdcChannel )`

Gets the ADC offset of the DACQ for a single channel

Parameters

<i>AdcChannel</i>	The ADC channel
-------------------	-----------------

Returns

The offset for the given channel number

**11.40.3.6 GetAudioOutDacParameter()** `void GetAudioOutDacParameter (   
 [System::Runtime::InteropServices::Out] uint32_t% Frequency,   
 [System::Runtime::InteropServices::Out] uint32_t% Amplification )`

Gets the parameter of the audio DAC output.

Parameters

<i>Frequency</i>	Frequency(1 - 25000 Hz)
<i>Amplification</i>	Amplification(0 - 0xFFFF)

**11.40.3.7 GetDacIdleValue()** `int32_t GetDacIdleValue (`  
`uint32_t DacChannel )`

Gets the DAC Idle value

**Parameters**

<i>DacChannel</i>	The DAC channel
-------------------	-----------------

**Returns**

The idle value

**11.40.3.8 GetDacOffset()** `int32_t GetDacOffset (`  
`LIH30_DAC_Channel_EnumNet DacChannel )`

Gets the offset of a DAC channel.

**Parameters**

<i>DacChannel</i>	The DAC channel
-------------------	-----------------

**Returns**

The offset for the given channel number

**11.40.3.9 GetDacqRunStatus()** `uint16_t GetDacqRunStatus ( )`

Gets the data acquisition running status

**Returns**

The status (1: running / 0: stopped)

**11.40.3.10 GetDacUseIdleValue()** `bool GetDacUseIdleValue (`  
`uint32_t DacChannel )`

Gets if the DAC Idle value is used after stimulation

## Parameters

<i>DacChannel</i>	The DAC channel
-------------------	-----------------

## Returns

Use idle value

**11.40.3.11 GetDigInState()** `uint16_t GetDigInState ( )`

Reads from the LIH30 digital input

## Returns

The bit mask defining the digital input state

**11.40.3.12 GetEepromPage()** `array<int8_t> ^ GetEepromPage (   
 uint32_t EepromStartAddress,   
 int EepromData_Length,   
 LIH30_EPC10_Bus_EnumNet epc10bus )`

Reads the requested amount of Eeprom byte from the EPC10 EEPROM

## Parameters

<i>EepromStartAddress</i>	start address of memory area to read from
<i>EepromData_Length</i>	The maximal length of EepromData.
<i>epc10bus</i>	The EPC10 bus

## Returns

pointer to internal memory for the requested amount of data

**11.40.3.13 GetSampleInterval()** `uint32_t GetSampleInterval ( )`

Gets the Sample Interval for the DACQ and Stimulation

## Returns

Sample Interval configured on the device

**11.40.3.14 IsUserTriggerEnabled()** `bool IsUserTriggerEnabled ( )`

Is the User Trigger enabled

**Returns**

Enabled

**11.40.3.15 ReadClipping()** `uint32_t ReadClipping (`  
`LIH30_EPC10_Bus_EnumNet epc10bus )`

Gets the clipping information

**Parameters**

<i>epc10bus</i>	The EPC10 bus
-----------------	---------------

**Returns**

The clipping value

**11.40.3.16 ReadUARTData()** `String ^ ReadUARTData ( )`

Reads the config string from the device.

**Returns**

The config string.

**11.40.3.17 SendCommand()** `void SendCommand (`  
`LIH30_EPC10_Bus_EnumNet epc10bus,`  
`uint16_t Command )`

Send command to the EPC10

**Parameters**

<i>epc10bus</i>	The EPC10 bus
<i>Command</i>	The command

**11.40.3.18 SetAdcOffset()** `void SetAdcOffset (`  
    `LIH30_ADC_Channel_EnumNet AdcChannel,`  
    `int32_t Offset )`

Sets the ADC offset of the DACQ for a single channel

**Parameters**

<i>AdcChannel</i>	The ADC channel
<i>Offset</i>	The offset for the given channel number

**11.40.3.19 SetAdcOffsetPermanent()** `void SetAdcOffsetPermanent (`  
    `LIH30_ADC_Channel_EnumNet AdcChannel )`

Writes the ADC offset of the DACQ for a single channel to permanent EEPROM memory

**Parameters**

<i>AdcChannel</i>	The ADC channel
-------------------	-----------------

**11.40.3.20 SetAudioOutDacParameter()** `void SetAudioOutDacParameter (`  
    `uint32_t Frequency,`  
    `uint32_t Amplification )`

Sets the parameter of the audio DAC output.

**Parameters**

<i>Frequency</i>	Frequency(1 - 25000 Hz)
<i>Amplification</i>	Amplification(0 - 0xFFFF)

**11.40.3.21 SetDacIdleValue()** `void SetDacIdleValue (`  
    `uint32_t DacChannel,`  
    `int32_t IdleValue )`

Sets the DAC Idle value

**Parameters**

<i>DacChannel</i>	The DAC channel
<i>IdleValue</i>	The idle value

**11.40.3.22 SetDacOffset()** `void SetDacOffset (`  
    `LIH30_DAC_Channel_EnumNet DacChannel,`  
    `int32_t Offset )`

Sets the offset of a DAC channel.

**Parameters**

<i>DacChannel</i>	The DAC channel
<i>Offset</i>	The offset for the given channel number

**11.40.3.23 SetDacOffsetPermanent()** `void SetDacOffsetPermanent (`  
    `LIH30_DAC_Channel_EnumNet DacChannel )`

Writes the DAC offset of the STG for a single channel to permanent EEPROM memory

**Parameters**

<i>DacChannel</i>	The DAC channel
-------------------	-----------------

**11.40.3.24 SetDacUseIdleValue()** `void SetDacUseIdleValue (`  
    `uint32_t DacChannel,`  
    `bool UseIdle )`

Sets if the DAC Idle value is used after stimulation

**Parameters**

<i>DacChannel</i>	The DAC channel
<i>UseIdle</i>	Use idle value

**11.40.3.25 SetDigOutState()** `void SetDigOutState (`  
    `uint16_t DigOutState )`

Writes to the LIH30 digital output

**Parameters**

<i>DigOutState</i>	The bit mask defining the digital output state
--------------------	--

**11.40.3.26 SetEepromPage()** `void SetEepromPage (`

```
uint32_t EepromStartAddress,
array< int8_t >^ EepromData,
LIH30_EPC10_Bus_EnumNet epc10bus )
```

Writes into EEprom on the EPC10 EEPROM

#### Parameters

<i>EepromStartAddress</i>	start address of memory area to write to
<i>EepromData</i>	pointer to internal memory for the supported amount of data
<i>epc10bus</i>	The EPC10 bus

**11.40.3.27 SetSampleInterval()** void SetSampleInterval (   
uint32\_t *SampleInterval* )

Sets the Sample Interval for the DACQ and Stimulation

#### Parameters

<i>SampleInterval</i>	between the samples, Sample interval is available from 1 to 4194303
-----------------------	---

**11.40.3.28 WriteUARTData()** void WriteUARTData (   
String^ *commandString* )

Write the command string to the device.

#### Parameters

<i>commandString</i>	The config string.
----------------------	--------------------

## 11.49 CMcsUsbDacqNet Class Reference

Base class for data acquisition devices.

Inheritance diagram for CMcsUsbDacqNet:

### Classes

- class [CHWInfo](#)  
*Class to provide hardware information about the device.*

### Public Member Functions

- [CMcsUsbDacqNet](#) ()
- [~CMcsUsbDacqNet](#) ()
- [uint32\\_t GetErrorMessage](#) ([System::Runtime::InteropServices::Out]String^% errorString, [System::Runtime::InteropServices::Out]int% info)
- [virtual uint32\\_t GetVoltageRangeIndex](#) (unsigned int virtualDevice)
- [virtual void SetVoltageRangeByIndex](#) (int32\_t voltageRangeIndex, unsigned int virtualDevice)  
*Sets the voltage range on devices which support multiple voltage ranges.*
- [virtual void SetVoltageRangeInMicroVolt](#) (int32\_t voltageRange, unsigned int virtualDevice)  
*Sets the voltage range on devices which support multiple voltage ranges.*
- [virtual int32\\_t GetVoltageRangeInMicroVolt](#) (unsigned int virtualDevice)  
*Gets the currently selected voltage range on devices which support multiple voltage ranges.*
- [virtual int32\\_t GetVoltageRangeInMilliVolt](#) ()  
*Gets the currently selected voltage range on devices which support multiple voltage ranges.*
- [virtual void SetDataMode](#) (DataModeEnumNet dataMode, unsigned int virtualDevice)  
*Sets the data mode, can be 16, 24 or 32bit, all signed or unsigned on the MEA2100 device.*
- [virtual DataModeEnumNet GetDataMode](#) (unsigned int virtualDevice)  
*Gets the data mode, can be 16, 24 or 32bit, all signed or unsigned on the MEA2100 device.*
- [void SetDigitalSource](#) (DigitalTargetEnumNet digitaltarget, int32\_t NrChannel, DigitalSourceEnumNet source, int bitnumber\_offset)  
*Sets the function/source of a digital output bit.*
- [void SetDigitalSource](#) (DigitalTargetEnumNet digitaltarget, int32\_t NrChannel, W2100DigitalSourceEnumNet source, int bitnumber\_offset)  
*Sets the function/source of a digital output bit.*
- [void SetDigitalSource](#) (DigitalTargetEnumNet digitaltarget, int32\_t NrChannel, SCUDigitalSourceEnumNet source, int bitnumber\_offset)  
*Sets the function/source of a digital output bit.*
- [void SetDigitalSource](#) (DigitalTargetEnumNet digitaltarget, int32\_t NrChannel, MEA2100\_256DigitalSourceEnumNet source, int bitnumber\_offset)  
*Sets the function/source of a digital output bit.*

- `template<typename digitalsourceenum >`  
`void SetDigitalSource (DigitalTargetEnumNet digitaltarget, int32_t NrChannel, DigitalSource< digital-`  
`sourceenum >^ source, int bitnumber_offset)`  
*Sets the function/source of an digital output bit.*
- `void GetDigitalSource (DigitalTargetEnumNet digitaltarget, int32_t NrChannel, [System::Runtime::Interop-`  
`Services::Out]DigitalSourceEnumNet% source, [System::Runtime::InteropServices::Out]int% bitnumber_`  
`offset)`  
*Gets the function/source of an digital output bit.*
- `void GetDigitalSource (DigitalTargetEnumNet digitaltarget, int32_t NrChannel, [System::Runtime::`  
`InteropServices::Out]W2100DigitalSourceEnumNet% source, [System::Runtime::InteropServices::Out]int%`  
`bitnumber_offset)`  
*Gets the function/source of an digital output bit.*
- `void GetDigitalSource (DigitalTargetEnumNet digitaltarget, int32_t NrChannel, [System::Runtime::`  
`InteropServices::Out]SCUDigitalSourceEnumNet% source, [System::Runtime::InteropServices::Out]int%`  
`bitnumber_offset)`  
*Gets the function/source of an digital output bit.*

#### 11.49.1 Detailed Description

Base class for data acquisition devices.

## 11.49.2 Constructor & Destructor Documentation

**11.49.2.1 CMcsUsbDacqNet()** `CMcsUsbDacqNet ( )`

**11.49.2.2 ~CMcsUsbDacqNet()** `~CMcsUsbDacqNet ( )`

## 11.49.3 Member Function Documentation

**11.49.3.1 AddSelectedChannelsQueue()** [1/4] `virtual int AddSelectedChannelsQueue (`  
`int nByteOffset,`  
`int nChannelOffset,`  
`array< bool >^ selectedChannels,`  
`int queuesize,`  
`int threshold,`  
`SampleSizeNet samplesize ) [virtual]`

Adds a common FIFO queue for all channels. Data in callback will be a list per channel. Use ChannelBlock\_Read↔FramesDict... with handle = 0 to read the data.

When using 32 bit data format, ChannelsInBlock is still the number of 16 bit channels per frame, as obtained from GetChannelsInBlock, while nChannels is the number of 32 bit channels to be read from the device. So when all channels from a device are read in 32 bit data format nChannels = ChannelsInBlock/2

### Parameters

<i>nByteOffset</i>	Number of bytes to start with.
--------------------	--------------------------------

### Parameters

<i>nChannelOffset</i>	Number of channel to start with (counted in samplesize bytes).
-----------------------	--

### Parameters

<i>selectedChannels</i>	List of channels to be collected in the FIFO.
-------------------------	---

## Parameters

<i>queuesize</i>	Size of sample frames the FIFO can hold.
------------------	--

## Parameters

<i>threshold</i>	Number of sample frames the FIFO must acquire before the callback function is called.
------------------	---

## Parameters

<i>samplesize</i>	size of the datawords, either 16 or 32bit.
-------------------	--

## Returns

The handle to the Queue.

**11.49.3.2 AddSelectedChannelsQueue() [2/4]** virtual int AddSelectedChannelsQueue (   
     int *nByteOffset*,   
     int *nChannelOffset*,   
     array< bool >^ *selectedChannels*,   
     int *queuesize*,   
     int *threshold*,   
     SampleSizeNet *samplesize*,   
     SampleDstSizeNet *sampleDstSize* ) [virtual]

**11.49.3.3 AddSelectedChannelsQueue() [3/4]** virtual int AddSelectedChannelsQueue (   
     int *nByteOffset*,   
     int *nChannelOffset*,   
     int *nChannels*,   
     int *queuesize*,   
     int *threshold*,   
     SampleSizeNet *samplesize* ) [virtual]

Adds a common FIFO queue for all channels. Data in callback will be a list per channel. Use ChannelBlock\_Read↔FramesDict... with handle = 0 to read the data.

When using 32 bit data format, ChannelsInBlock is still the number of 16 bit channels per frame, as obtained from GetChannelsInBlock, while nChannels is the number of 32 bit channels to be read from the device. So when all channels from a device are read in 32 bit data format nChannels = ChannelsInBlock/2

**Parameters**

<i>nByteOffset</i>	Number of bytes to start with.
--------------------	--------------------------------

**Parameters**

<i>nChannelOffset</i>	Number of channel to start with (counted in samplesize bytes).
-----------------------	--

**Parameters**

<i>nChannels</i>	Number of channels to be collected in the FIFO.
------------------	---

**Parameters**

<i>queuesize</i>	Size of sample frames the FIFO can hold.
------------------	--

**Parameters**

<i>threshold</i>	Number of sample frames the FIFO must acquire before the callback function is called.
------------------	---

**Parameters**

<i>samplesize</i>	size of the datawords, either 16 or 32bit.
-------------------	--

**Returns**

The handle to the Queue.

**11.49.3.4 AddSelectedChannelsQueue()** [4/4] virtual int AddSelectedChannelsQueue (   
     int *nByteOffset*,   
     int *nChannelOffset*,   
     int *nChannels*,   
     int *queuesize*,   
     int *threshold*,   
     SampleSizeNet *samplesize*,   
     SampleDstSizeNet *sampleDstSize* ) [virtual]

**11.49.3.5 ChannelBlock\_AvailFrames()** [1/2] virtual uint32\_t ChannelBlock\_AvailFrames (   
     int *handle* ) [virtual]

Get the number of sample frames already available in the FIFO.

#### Parameters

<i>handle</i>	Handle of the FIFO queue. Either zero when the SetSelectedData call was used or the channel number.
---------------	---

#### Returns

Number of sample frames available in the FIFO.

**11.49.3.6 ChannelBlock\_AvailFrames()** [2/2] virtual uint32\_t ChannelBlock\_AvailFrames (   
     int *handle*,   
     int *queue* ) [virtual]

**11.49.3.7 ChannelBlock\_ReadAsFrameArrayI16()** [1/2] virtual array<array<int16\_t>^> ^ Channel↵  
 Block\_ReadAsFrameArrayI16 (   
     int *handle*,   
     int *frames*,   
     [System::Runtime::InteropServices::Out] int % *frames\_ret* ) [virtual]

Read data from a FIFO queue as array of uint16\_t data frame arrays

#### Parameters

<i>handle</i>	Handle of the FIFO queue. Zero when the SetSelectedData call was used.
---------------	--

**Parameters**

<i>frames</i>	Number of sample frames to read.
---------------	----------------------------------

**Parameters**

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**Returns**

Array of int16\_t frame arrays.

```
11.49.3.8 ChannelBlock_ReadAsFrameArrayI16() [2/2]  virtual array<array<int16_t>^> ^ Channel↔
Block_ReadAsFrameArrayI16 (
    int handle,
    int queue,
    int frames,
    [System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]
```

Read data from a FIFO queue as array of uint16\_t data frame arrays

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Zero when the SetSelectedData call was used.
---------------	--

**Parameters**

<i>queue</i>	Number of the sub queue.
<i>frames</i>	Number of sample frames to read.

**Parameters**

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**Returns**

Array of int16\_t frame arrays.

**11.49.3.9 ChannelBlock\_ReadAsFrameArrayI32()** [1/2] virtual array<array<int32\_t>^> ^ Channel↔  
 Block\_ReadAsFrameArrayI32 (   
     int *handle*,  
     int *frames*,  
     [System::Runtime::InteropServices::Out] int % *frames\_ret* ) [virtual]

Read data from a FIFO queue as array of uint16\_t data frame arrays

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Zero when the SetSelectedData call was used.
---------------	--

**Parameters**

<i>frames</i>	Number of sample frames to read.
---------------	----------------------------------

**Parameters**

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**Returns**

Array of int32\_t frame arrays.

**11.49.3.10 ChannelBlock\_ReadAsFrameArrayI32()** [2/2] virtual array<array<int32\_t>^> ^ Channel↔  
 Block\_ReadAsFrameArrayI32 (   
     int *handle*,  
     int *queue*,  
     int *frames*,  
     [System::Runtime::InteropServices::Out] int % *frames\_ret* ) [virtual]

Read data from a FIFO queue as array of uint16\_t data frame arrays

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Zero when the SetSelectedData call was used.
<i>queue</i>	Number of the sub queue.
<i>frames</i>	Number of sample frames to read.

**Parameters**

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**Returns**

Array of int32\_t frame arrays.

**11.49.3.11 ChannelBlock\_ReadAsFrameArrayUI16()** [1/2] `virtual array<array<uint16_t>^> ^`

```
ChannelBlock_ReadAsFrameArrayUI16 (
    int handle,
    int frames,
    [System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]
```

Read data from a FIFO queue as array of uint16\_t data frame arrays

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Zero when the SetSelectedData call was used.
---------------	--

**Parameters**

<i>frames</i>	Number of sample frames to read.
---------------	----------------------------------

**Parameters**

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**Returns**

Array of uint16\_t frame arrays.

**11.49.3.12 ChannelBlock\_ReadAsFrameArrayUI16()** [2/2] virtual array<array<uint16\_t>^> ^

```
ChannelBlock_ReadAsFrameArrayUI16 (
    int handle,
    int queue,
    int frames,
    [System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]
```

Read data from a FIFO queue as array of uint16\_t data frame arrays

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Zero when the SetSelectedData call was used.
---------------	--

**Parameters**

<i>queue</i>	Number of the sub queue.
<i>frames</i>	Number of sample frames to read.

**Parameters**

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**Returns**

Array of uint16\_t frame arrays.

**11.49.3.13 ChannelBlock\_ReadAsFrameArrayUI32()** [1/2] virtual array<array<uint32\_t>^> ^

```
ChannelBlock_ReadAsFrameArrayUI32 (
    int handle,
    int frames,
    [System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]
```

Read data from a FIFO queue as array of uint16\_t data frame arrays

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Zero when the SetSelectedData call was used.
---------------	--

**Parameters**

<i>frames</i>	Number of sample frames to read.
---------------	----------------------------------

**Parameters**

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**Returns**

Array of uint32\_t frame arrays.

**11.49.3.14 ChannelBlock\_ReadAsFrameArrayUI32()** [2/2] `virtual array<array<uint32_t>^> ^`

```
ChannelBlock_ReadAsFrameArrayUI32 (  
    int handle,  
    int queue,  
    int frames,  
    [System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]
```

Read data from a FIFO queue as array of uint16\_t data frame arrays

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Zero when the SetSelectedData call was used.
---------------	--

**Parameters**

<i>queue</i>	Number of the sub queue.
<i>frames</i>	Number of sample frames to read.

## Parameters

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

## Returns

Array of uint32\_t frame arrays.

**11.49.3.15 ChannelBlock\_ReadFramesDictI16()** virtual System::Collections::Generic::Dictionary<int, array<int16\_t>> ^ ChannelBlock\_ReadFramesDictI16 (   
     int *handle*,  
     int *frames*,  
     [System::Runtime::InteropServices::Out] int % *frames\_ret* ) [virtual]

Read data from a FIFO queue in int16\_t data format, that contains subqueues, each populates an entry in the dictionary by hardware channel number

## Parameters

<i>handle</i>	Handle of the FIFO queue. Zero when the SetSelectedChannelsQueue call was used.
---------------	---

## Parameters

<i>frames</i>	Number of sample frames to read.
<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.

## Returns

Dictionary of int16\_t arrays and hardware channel as key.

**11.49.3.16 ChannelBlock\_ReadFramesDictI32()** virtual System::Collections::Generic::Dictionary<int, array<int32\_t>> ^ ChannelBlock\_ReadFramesDictI32 (   
     int *handle*,  
     int *frames*,  
     [System::Runtime::InteropServices::Out] int % *frames\_ret* ) [virtual]

Read data from a FIFO queue in int32\_t data format, that contains subqueues, each populates an entry in the dictionary by hardware channel number

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Zero when the SetSelectedChannelsQueue call was used.
---------------	---

**Parameters**

<i>frames</i>	Number of sample frames to read.
<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.

**Returns**

Dictionary of int32\_t arrays and hardware channel as key.

**11.49.3.17 ChannelBlock\_ReadFramesDictUI16()** `virtual System::Collections::Generic::Dictionary<int, array<uint16_t>^> ^ ChannelBlock_ReadFramesDictUI16 ( int handle, int frames, [System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]`

Read data from a FIFO queue in uint16\_t data format, that contains subqueues, each populates an entry in the dictionary by hardware channel number

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Zero when the SetSelectedChannelsQueue call was used.
---------------	---

**Parameters**

<i>frames</i>	Number of sample frames to read.
<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.

**Returns**

Dictionary of uint16\_t arrays and hardware channel as key.

**11.49.3.18 ChannelBlock\_ReadFramesDictUI32()** virtual System::Collections::Generic::Dictionary<int, array<uint32\_t>^> ^ ChannelBlock\_ReadFramesDictUI32 ( int *handle*, int *frames*, [System::Runtime::InteropServices::Out] int % *frames\_ret* ) [virtual]

Read data from a FIFO queue in uint32\_t data format, that contains subqueues, each populates an entry in the dictionary by hardware channel number

#### Parameters

<i>handle</i>	Handle of the FIFO queue. Zero when the SetSelectedChannelsQueue call was used.
---------------	---

#### Parameters

<i>frames</i>	Number of sample frames to read.
<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.

#### Returns

Dictionary of uint32\_t arrays and hardware channel as key.

**11.49.3.19 ChannelBlock\_ReadFramesI16()** [1/2] virtual void ChannelBlock\_ReadFramesI16 ( int *handle*, array< int16\_t >^ *buffer*, int *frames\_pos*, int *frames*, [System::Runtime::InteropServices::Out] int % *frames\_ret* ) [virtual]

Read data from a FIFO queue in int16\_t data format

#### Parameters

<i>handle</i>	Handle of the FIFO queue. Either zero when the SetSelectedData call was used or the channel number.
---------------	---

#### Parameters

<i>buffer</i>	Buffer to put the data from the device in.
<i>frames_pos</i>	Position in buffer where to put the data.
<i>frames</i>	Number of sample frames to read.

**Parameters**

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**11.49.3.20 ChannelBlock\_ReadFramesI16()** [2/2] `virtual array<int16_t> ^ ChannelBlock_ReadFramesI16 (`

```
    int handle,  
    int frames,  
    [System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]
```

Read data from a FIFO queue in int16\_t data format

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Either zero when the SetSelectedData call was used or the channel number.
---------------	---

**Parameters**

<i>frames</i>	Number of sample frames to read.
---------------	----------------------------------

**Parameters**

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**11.49.3.21 ChannelBlock\_ReadFramesI32()** [1/2] `virtual void ChannelBlock_ReadFramesI32 (`

```
    int handle,  
    array< int32_t > ^ buffer,  
    int frames_pos,  
    int frames,  
    [System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]
```

Read data from a FIFO queue in uint32\_t data format

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Either zero when the SetSelectedData call was used or the channel number.
---------------	---

## Parameters

<i>buffer</i>	Buffer to put the data from the device in.
<i>frames_pos</i>	Position in buffer where to put the data.
<i>frames</i>	Number of sample frames to read.

## Parameters

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**11.49.3.22 ChannelBlock\_ReadFramesI32()** [2/2] `virtual array<int32_t> ^ ChannelBlock_ReadFramesI32 (`  
`int handle,`  
`int frames,`  
`[System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]`

Read data from a FIFO queue in uint32\_t data format

## Parameters

<i>handle</i>	Handle of the FIFO queue. Either zero when the SetSelectedData call was used or the channel number.
---------------	---

## Parameters

<i>frames</i>	Number of sample frames to read.
---------------	----------------------------------

## Parameters

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**11.49.3.23 ChannelBlock\_ReadFramesUI16()** [1/2] `virtual void ChannelBlock_ReadFramesUI16 (`  
`int handle,`

```

array< uint16_t >^ buffer,
int frames_pos,
int frames,
[System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]

```

Read data from a FIFO queue in uint16\_t data format

#### Parameters

<i>handle</i>	Handle of the FIFO queue. Either zero when the SetSelectedData call was used or the channel number.
<i>buffer</i>	Buffer to put the data from the device in.
<i>frames_pos</i>	Position in buffer where to put the data.
<i>frames</i>	Number of sample frames to read.

#### Parameters

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**11.49.3.24 ChannelBlock\_ReadFramesUI16()** [2/2] virtual array<uint16\_t> ^ ChannelBlock\_Read↔  
FramesUI16 (

```

    int handle,
    int frames,
[System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]

```

Read data from a FIFO queue in uint16\_t data format

#### Parameters

<i>handle</i>	Handle of the FIFO queue. Either zero when the SetSelectedData call was used or the channel number.
---------------	---

#### Parameters

<i>frames</i>	Number of sample frames to read.
---------------	----------------------------------

#### Parameters

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**Returns**

Array of data from the device.

**11.49.3.25 ChannelBlock\_ReadFramesUI32()** [1/2] `virtual void ChannelBlock_ReadFramesUI32 (`  
`int handle,`  
`array< uint32_t >^ buffer,`  
`int frames_pos,`  
`int frames,`  
`[System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]`

Read data from a FIFO queue in uint32\_t data format

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Either zero when the SetSelectedData call was used or the channel number.
---------------	---

**Parameters**

<i>buffer</i>	Buffer to put the data from the device in.
<i>frames_pos</i>	Position in buffer where to put the data.
<i>frames</i>	Number of sample frames to read.

**Parameters**

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**11.49.3.26 ChannelBlock\_ReadFramesUI32()** [2/2] `virtual array<uint32_t> ^ ChannelBlock_ReadFramesUI32 (`  
`int handle,`  
`int frames,`  
`[System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]`

Read data from a FIFO queue in uint32\_t data format

**Parameters**

<i>handle</i>	Handle of the FIFO queue. Either zero when the SetSelectedData call was used or the channel number.
---------------	---

**Parameters**

<i>frames</i>	Number of sample frames to read.
---------------	----------------------------------

**Parameters**

<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.
-------------------	--

**11.49.3.27 ClearBuffers()** `virtual void ClearBuffers ( ) [virtual]`

**11.49.3.28 CMcsUsbDacqNet::GetFilterProperties()** `virtual array<CFilterPropertyNet^> ^ CMcsUsbDacqNet::GetFilterProperties ( DacqGroupChannelEnumNet GroupID ) [virtual]`

**11.49.3.29 GetAdapterType()** `virtual AdapterTypeEnumNet GetAdapterType ( ) [virtual]`

Gets the adapter which is connected to the MEA2100 device.

**Returns**

AdapterTypeEnumNet which enumerates the possible adapters.

**11.49.3.30 GetAdcDataFormat()** `virtual uint32_t GetAdcDataFormat ( uint32_t virtualDevice ) [virtual]`

Gets the ADC data format, 16 means 16 bits, 24 means 24 bits, 32 means 32 bits.

**Returns**

The data format in bits.

**11.49.3.31 GetAdcZero()** virtual uint32\_t GetAdcZero (   
 uint32\_t virtualDevice,   
 DacqGroupChannelEnumNet group,   
 [System::Runtime::InteropServices::Out] int% adcZ ) [virtual]

**11.49.3.32 GetAnalogValueUnit()** virtual uint32\_t GetAnalogValueUnit (   
 uint32\_t virtualDevice,   
 DacqGroupChannelEnumNet group,   
 [System::Runtime::InteropServices::Out] AnalogUnitEnumNet% unit ) [virtual]

**11.49.3.33 GetChannelDataFillSize()** int GetChannelDataFillSize ( )

**11.49.3.34 GetChannelLayout()** virtual void GetChannelLayout (   
 [System::Runtime::InteropServices::Out] int% AnalogChannels,   
 [System::Runtime::InteropServices::Out] int% DigitalChannels,   
 [System::Runtime::InteropServices::Out] int% ChecksumChannels,   
 [System::Runtime::InteropServices::Out] int% TimestampChannels,   
 [System::Runtime::InteropServices::Out] int% ChannelsInBlock,   
 unsigned int virtualDevice ) [virtual]

**11.49.3.35 GetChannelsInBlock()** virtual int32\_t GetChannelsInBlock (   
 unsigned int virtualDevice ) [virtual]

Get the number of 16 bit datawords which will be collected per sample frame, use after the device is configured.

#### Returns

Number of 16 bit datawords per sample frame.

**11.49.3.36 GetDataFormat()** virtual uint32\_t GetDataFormat (   
 uint32\_t virtualDevice,   
 DacqGroupChannelEnumNet group,   
 [System::Runtime::InteropServices::Out] int% numberOfBits ) [virtual]

**11.49.3.37 GetDataMode()** virtual DataModeEnumNet GetDataMode (   
 unsigned int virtualDevice ) [virtual]

Gets the data mode, can be 16, 24 or 32bit, all signed or unsigned on the MEA2100 device.

## Parameters

<i>virtualDevice</i>	Virtual device to use.
----------------------	------------------------

## Returns

DataModeEnumNet which enumerates the possible data modes.

**11.49.3.38 GetDigitalSource() [1/5]** void GetDigitalSource (   
     DigitalTargetEnumNet digitaltarget,   
     int32\_t NrChannel,   
     [System::Runtime::InteropServices::Out] DigitalSource< digitalsourceenum >^%   
     source,   
     [System::Runtime::InteropServices::Out] int% bitnumber\_offset )

Gets the function/source of an digital output bit.

This is the templated generic implementation.

## Parameters

<i>digitaltarget</i>	The digital target to query.
<i>NrChannel</i>	The channel/bit of target to query.
<i>source</i>	The source/function assignd to the digital target.
<i>bitnumber_offset</i>	An offset / bit number with the source/function.

**11.49.3.39 GetDigitalSource() [2/5]** void GetDigitalSource (   
     DigitalTargetEnumNet digitaltarget,   
     int32\_t NrChannel,   
     [System::Runtime::InteropServices::Out] DigitalSourceEnumNet% source,   
     [System::Runtime::InteropServices::Out] int% bitnumber\_offset )

Gets the function/source of an digital output bit.

This overload is for the MEA2100 device.

## Parameters

<i>digitaltarget</i>	The digital target to query.
<i>NrChannel</i>	The channel/bit of target to query.
<i>source</i>	The source/function assignd to the digital target.
<i>bitnumber_offset</i>	An offset / bit number with the source/function.

**11.49.3.40 GetDigitalSource() [3/5]** `void GetDigitalSource (   
     DigitalTargetEnumNet digitaltarget,   
     int32_t NrChannel,   
     [System::Runtime::InteropServices::Out] MEA2100_256DigitalSourceEnumNet% source,   
     [System::Runtime::InteropServices::Out] int% bitnumber_offset )`

Gets the function/source of an digital output bit.

This overload is for the MEA2100-256 device.

#### Parameters

<i>digitaltarget</i>	The digital target to query.
<i>NrChannel</i>	The channel/bit of target to query.
<i>source</i>	The source/function assignd to the digital target.
<i>bitnumber_offset</i>	An offset / bit number with the source/function.

**11.49.3.41 GetDigitalSource() [4/5]** `void GetDigitalSource (   
     DigitalTargetEnumNet digitaltarget,   
     int32_t NrChannel,   
     [System::Runtime::InteropServices::Out] SCUDigitalSourceEnumNet% source,   
     [System::Runtime::InteropServices::Out] int% bitnumber_offset )`

Gets the function/source of an digital output bit.

This overload is for the SCU device.

#### Parameters

<i>digitaltarget</i>	The digital target to query.
<i>NrChannel</i>	The channel/bit of target to query.
<i>source</i>	The source/function assignd to the digital target.
<i>bitnumber_offset</i>	An offset / bit number with the source/function.

**11.49.3.42 GetDigitalSource() [5/5]** `void GetDigitalSource (   
     DigitalTargetEnumNet digitaltarget,   
     int32_t NrChannel,   
     [System::Runtime::InteropServices::Out] W2100DigitalSourceEnumNet% source,   
     [System::Runtime::InteropServices::Out] int% bitnumber_offset )`

Gets the function/source of an digital output bit.

This overload is for the W2100 device.

#### Parameters

<i>digitaltarget</i>	The digital target to query.
<i>NrChannel</i>	The channel/bit of target to query.
<i>source</i>	The source/function assignd to the digital target.
<i>bitnumber_offset</i>	An offset / bit number with the source/function.

**11.49.3.43 GetErrorMessage()** `uint32_t GetErrorMessage (`  
`[System::Runtime::InteropServices::Out] String^% errorString,`  
`[System::Runtime::InteropServices::Out] int% info )`

**11.49.3.44 GetFilterProperty()** `virtual CFilterPropertyNet ^ GetFilterProperty (`  
`DacqGroupChannelEnumNet GroupID,`  
`unsigned int index ) [virtual]`

**11.49.3.45 GetGroupChannelDataI16()** `virtual System::Collections::Generic::Dictionary<int,`  
`array<int16_t>^> ^ GetGroupChannelDataI16 (`  
`DacqGroupChannelEnumNet group,`  
`int frames,`  
`[System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]`

Read data from a FIFO queue in int16\_t data format, that contains subqueues, each populates an entry in the dictionary by hardware channel number

#### Parameters

<i>group</i>	Group selector supported by the device.
--------------	---

#### Parameters

<i>frames</i>	Number of sample frames to read.
<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.

#### Returns

Dictionary of int16\_t arrays and hardware channel as key.

**11.49.3.46 GetGroupChannelDataI32()** `virtual System::Collections::Generic::Dictionary<int,`  
`array<int32_t>^> ^ GetGroupChannelDataI32 (`  
`DacqGroupChannelEnumNet group,`  
`int frames,`  
`[System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]`

Read data from a FIFO queue in int32\_t data format, that contains subqueues, each populates an entry in the dictionary by hardware channel number

## Parameters

<i>group</i>	Group selector supported by the device.
--------------	---

## Parameters

<i>frames</i>	Number of sample frames to read.
<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.

## Returns

Dictionary of int32\_t arrays and hardware channel as key.

**11.49.3.47 GetGroupChannelDataUI16()** `virtual System::Collections::Generic::Dictionary<int, array<uint16_t>>^> ^ GetGroupChannelDataUI16 ( DacqGroupChannelEnumNet group, int frames, [System::Runtime::InteropServices::Out] int % frames_ret ) [virtual]`

Read data from a FIFO queue in uint16\_t data format, that contains subqueues, each populates an entry in the dictionary by hardware channel number

## Parameters

<i>group</i>	Group selector supported by the device.
--------------	---

## Parameters

<i>frames</i>	Number of sample frames to read.
<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.

## Returns

Dictionary of uint16\_t arrays and hardware channel as key.

**11.49.3.48 GetGroupChannelDataUI32()** virtual System::Collections::Generic::Dictionary<int, array<uint32\_t>^> ^ GetGroupChannelDataUI32 (   
     DacqGroupChannelEnumNet group,   
     int frames,   
     [System::Runtime::InteropServices::Out] int % frames\_ret ) [virtual]

Read data from a FIFO queue in uint32\_t data format, that contains subqueues, each populates an entry in the dictionary by hardware channel number

#### Parameters

<i>group</i>	Group selector supported by the device.
--------------	---

#### Parameters

<i>frames</i>	Number of sample frames to read.
<i>frames_ret</i>	Number of sample frames which were read, might be smaller than frames.

#### Returns

Dictionary of uint32\_t arrays and hardware channel as key.

**11.49.3.49 GetHardwareMaxRange()** virtual uint32\_t GetHardwareMaxRange (   
     uint32\_t virtualDevice,   
     DacqGroupChannelEnumNet group,   
     [System::Runtime::InteropServices::Out] int% r,   
     [System::Runtime::InteropServices::Out] int% rUnit ) [virtual]

**11.49.3.50 GetHardwareMinRange()** virtual uint32\_t GetHardwareMinRange (   
     uint32\_t virtualDevice,   
     DacqGroupChannelEnumNet group,   
     [System::Runtime::InteropServices::Out] int% r,   
     [System::Runtime::InteropServices::Out] int% rUnit ) [virtual]

**11.49.3.51 GetMaxSamplingFrequency()** virtual uint32\_t GetMaxSamplingFrequency (   
     int virtualDevice ) [virtual]

Gets the maximal sampling frequency of the device.

#### Returns

Sampling frequency in Hz.

**11.49.3.52 GetMeaLayout()** virtual [MeaLayoutEnumNet](#) GetMeaLayout ( ) [virtual]

Gets the MEA layout which is connected to the MEA2100 device.

#### Returns

MeaLayoutEnumNet which enumerates the MEA types.

**11.49.3.53 GetMinSamplingFrequencyStepsize()** virtual uint32\_t GetMinSamplingFrequencyStepsize ( ) [virtual]

Gets the minimal sampling frequency step size increment value of the device.

#### Returns

Sampling frequency step size in Hz.

**11.49.3.54 GetNumberOfDataBits()** virtual uint32\_t GetNumberOfDataBits ( uint32\_t virtualDevice, [DacqGroupChannelEnumNet](#) group, [System::Runtime::InteropServices::Out] int% numberOfBits ) [virtual]

Get the real number of data bits.

This value may be different from the value returned by GetDataFormat, e.g. in MC\_Card the data are shifted 2 bits so the real number is 14 while the data format is 16 bits

**11.49.3.55 GetPoti()** virtual uint32\_t GetPoti ( uint32\_t channel, [System::Runtime::InteropServices::Out] uint32\_t% value ) [virtual]

**11.49.3.56 GetResolutionPerDigit()** virtual uint32\_t GetResolutionPerDigit ( uint32\_t virtualDevice, [DacqGroupChannelEnumNet](#) group, [System::Runtime::InteropServices::Out] int% res, [System::Runtime::InteropServices::Out] int% resUnit ) [virtual]

**11.49.3.57 GetSamplerate()** virtual int32\_t GetSamplerate ( unsigned int virtualDevice ) [virtual]

Gets the sampling frequency of the device.

#### Returns

Sampling frequency in Hz.

**11.49.3.58 GetVoltageRangeIndex()** `virtual uint32_t GetVoltageRangeIndex ( unsigned int virtualDevice ) [virtual]`

**11.49.3.59 GetVoltageRangeInMicroVolt()** `virtual int32_t GetVoltageRangeInMicroVolt ( unsigned int virtualDevice ) [virtual]`

Gets the currently selected voltage range on devices which support multiple voltage ranges.

**Returns**

The Voltage Range in uV.

**11.49.3.60 GetVoltageRangeInMilliVolt()** `virtual int32_t GetVoltageRangeInMilliVolt ( ) [virtual]`

Gets the currently selected voltage range on devices which support multiple voltage ranges.

**Returns**

The rounded Voltage Range in mV.

**11.49.3.61 HWInfo()** `CHWInfo ^ HWInfo ( )`

**11.49.3.62 SendStartDacq()** [1/2] `virtual void SendStartDacq ( ) [virtual]`

Start sampling.

**11.49.3.63 SendStartDacq()** [2/2] `virtual void SendStartDacq ( int VirtualDacqMap ) [virtual]`

Start sampling.

**Parameters**

<i>VirtualDacqMap</i>	
-----------------------	--

**11.49.3.64 SendStartStgAndDacq()** virtual void SendStartStgAndDacq (   
     uint32\_t *trigger\_map*,   
     int *VirtualDacqMap* ) [virtual]

Start sampling together with the STG.

Parameters

<i>trigger_map</i>	
<i>VirtualDacqMap</i>	

**11.49.3.65 SendStopDacq()** [1/2] virtual void SendStopDacq ( ) [virtual]

Stop sampling.

**11.49.3.66 SendStopDacq()** [2/2] virtual void SendStopDacq (   
     int *VirtualDacqMap* ) [virtual]

Stop sampling.

Parameters

<i>VirtualDacqMap</i>	
-----------------------	--

**11.49.3.67 SendStopStgAndDacq()** virtual void SendStopStgAndDacq (   
     uint32\_t *trigger\_map*,   
     int *VirtualDacqMap* ) [virtual]

Stop sampling together with the STG.

Parameters

<i>trigger_map</i>	
--------------------	--

**11.49.3.68 SendStopStgAndDacqWithOptions()** virtual void SendStopStgAndDacqWithOptions (   
     uint32\_t *trigger\_map*,

```
int VirtualDacqMap,
int options ) [virtual]
```

Stop sampling together with the STG and options.

#### Parameters

<i>trigger_map</i>	
--------------------	--

#### Parameters

<i>options</i>	
----------------	--

#### Parameters

<i>VirtualDacqMap</i>	
-----------------------	--

**11.49.3.69 SetDataMode()** virtual void SetDataMode (   
*DataModeEnumNet* *dataMode*,   
unsigned int *virtualDevice* ) [virtual]

Sets the data mode, can be 16, 24 or 32bit, all signed or unsigned on the MEA2100 device.

#### Parameters

<i>dataMode</i>	DataModeEnumNet enumerates the possible data modes.
<i>virtualDevice</i>	Virtual device to use.

**11.49.3.70 SetDigitalSource()** [1/5] void SetDigitalSource (   
*DigitalTargetEnumNet* *digitaltarget*,   
int32\_t *NrChannel*,   
*DigitalSource*< digitalsourceenum >^ *source*,   
int *bitnumber\_offset* )

Sets the function/source of an digital output bit.

This is the templated generic implementation.

## Parameters

<i>digitaltarget</i>	The digital target to change.
<i>NrChannel</i>	The channel/bit of target to change.
<i>source</i>	The source/function to assign to the digital target.
<i>bitnumber_offset</i>	An offset / bit number with the source/function.

**11.49.3.71 SetDigitalSource() [2/5]** `void SetDigitalSource (`  
`DigitalTargetEnumNet digitaltarget,`  
`int32_t NrChannel,`  
`DigitalSourceEnumNet source,`  
`int bitnumber_offset )`

Sets the function/source of an digital output bit.

This overload is for the MEA2100 device.

## Parameters

<i>digitaltarget</i>	The digital target to change.
<i>NrChannel</i>	The channel/bit of target to change.
<i>source</i>	The source/function to assign to the digital target.
<i>bitnumber_offset</i>	An offset / bit number with the source/function.

**11.49.3.72 SetDigitalSource() [3/5]** `void SetDigitalSource (`  
`DigitalTargetEnumNet digitaltarget,`  
`int32_t NrChannel,`  
`MEA2100_256DigitalSourceEnumNet source,`  
`int bitnumber_offset )`

Sets the function/source of an digital output bit.

This overload is for the MEA2100-256 device.

## Parameters

<i>digitaltarget</i>	The digital target to change.
<i>NrChannel</i>	The channel/bit of target to change.
<i>source</i>	The source/function to assign to the digital target.
<i>bitnumber_offset</i>	An offset / bit number with the source/function.

**11.49.3.73 SetDigitalSource() [4/5]** `void SetDigitalSource (`  
`DigitalTargetEnumNet digitaltarget,`

```

int32_t NrChannel,
SCUDigitalSourceEnumNet source,
int bitnumber_offset )

```

Sets the function/source of an digital output bit.

This overload is for the SCU device.

#### Parameters

<i>digitaltarget</i>	The digital target to change.
<i>NrChannel</i>	The channel/bit of target to change.
<i>source</i>	The source/function to assign to the digital target.
<i>bitnumber_offset</i>	An offset / bit number with the source/function.

**11.49.3.74 SetDigitalSource()** [5/5] `void SetDigitalSource (`  
`DigitalTargetEnumNet digitaltarget,`  
`int32_t NrChannel,`  
`W2100DigitalSourceEnumNet source,`  
`int bitnumber_offset )`

Sets the function/source of an digital output bit.

This overload is for the W2100 device.

#### Parameters

<i>digitaltarget</i>	The digital target to change.
<i>NrChannel</i>	The channel/bit of target to change.
<i>source</i>	The source/function to assign to the digital target.
<i>bitnumber_offset</i>	An offset / bit number with the source/function.

**11.49.3.75 SetPoti()** `virtual uint32_t SetPoti (`  
`uint32_t channel,`  
`uint32_t value,`  
`bool write_nvram ) [virtual]`

**11.49.3.76 SetSamplerate()** `virtual void SetSamplerate (`  
`int32_t rate,`  
`unsigned int oversample,`  
`unsigned int virtualDevice ) [virtual]`

Sets the sampling frequency of the device.

## Parameters

<i>rate</i>	Sampling frequency in Hz.
-------------	---------------------------

**11.49.3.77 SetSelectedChannels() [1/4]** virtual void SetSelectedChannels (   
     array< bool >^ *selectedChannels*,   
     int *queuesize*,   
     int *threshold*,   
     SampleSizeNet *samplesize*,   
     int *ChannelsInBlock* ) [virtual]

Create a FIFO queue per channel. Each channel will have its own FIFO and Callback function.

When using a 32bit sample size, the number obtained from GetChannelsInBlock must be divided by 2 to be used here, since GetChannelsInBlock returns the number of 16 bit datapoints per sample frame, while this functions uses the number of sample frames in its own data format.

## Parameters

<i>selectedChannels</i>	List of channels to be collected in the FIFO.
-------------------------	---

## Parameters

<i>queuesize</i>	Size of sample frames the FIFO can hold.
------------------	--

## Parameters

<i>threshold</i>	Number of sample frames the FIFO must acquire before the callback function is called.
------------------	---

## Parameters

<i>samplesize</i>	size of the datawords, either 16 or 32bit.
-------------------	--

## Parameters

<i>ChannelsInBlock</i>	value obtained from GetChannelsInBlock.
------------------------	---

**11.49.3.78 SetSelectedChannels() [2/4]** virtual void SetSelectedChannels (   
array< bool >^ *selectedChannels*,  
int *queuesize*,  
int *threshold*,  
SampleSizeNet *samplesize*,  
SampleDstSizeNet *sampleDstSize*,  
int *ChannelsInBlock* ) [virtual]

**11.49.3.79 SetSelectedChannels() [3/4]** virtual void SetSelectedChannels (   
int *nChannels*,  
int *queuesize*,  
int *threshold*,  
SampleSizeNet *samplesize*,  
int *ChannelsInBlock* ) [virtual]

Create a FIFO queue per channel. Each channel will have its own FIFO and Callback function.

When using a 32bit sample size, the number obtained from GetChannelsInBlock must be divided by 2 to be used here, since GetChannelsInBlock returns the number of 16 bit datapoints per sample frame, while this functions uses the number of sample frames in its own data format.

**Parameters**

<i>nChannels</i>	Number of channels to be collected in the FIFO.
------------------	---

**Parameters**

<i>queuesize</i>	Size of sample frames the FIFO can hold.
------------------	--

**Parameters**

<i>threshold</i>	Number of samples frames the FIFO must acquire before the callback function is called.
------------------	--

**Parameters**

<i>samplesize</i>	size of the datawords, either 16 or 32bit.
<i>ChannelsInBlock</i>	value obtained from GetChannelsInBlock.

**11.49.3.80 SetSelectedChannels()** [4/4] virtual void SetSelectedChannels (

```

    int nChannels,
    int queuesize,
    int threshold,
    SampleSizeNet samplesize,
    SampleDstSizeNet sampleDstSize,
    int ChannelsInBlock ) [virtual]

```

**11.49.3.81 SetSelectedChannelsQueue()** [1/4] virtual void SetSelectedChannelsQueue (

```

    array< bool >^ selectedChannels,
    int queuesize,
    int threshold,
    SampleSizeNet samplesize,
    int ChannelsInBlock ) [virtual]

```

Create a common FIFO queue for all channels. Data in callback will be a list per channel. Use ChannelBlock\_↔ ReadFramesDict... with handle = 0 to read the data.

When using 32 bit data format, ChannelsInBlock is still the number of 16 bit channels per frame, as obtained from GetChannelsInBlock, while nChannels is the number of 32 bit channels to be read from the device. So when all channels from a device are read in 32 bit data format nChannels = ChannelsInBlock/2

#### Parameters

<i>selectedChannels</i>	List of channels to be collected in the FIFO.
-------------------------	---

#### Parameters

<i>queuesize</i>	Size of sample frames the FIFO can hold.
------------------	--

#### Parameters

<i>threshold</i>	Number of sample frames the FIFO must acquire before the callback function is called.
------------------	---

#### Parameters

<i>samplesize</i>	size of the datawords, either 16 or 32bit.
-------------------	--

**Parameters**

<i>ChannelsInBlock</i>	value obtained from GetChannelsInBlock.
------------------------	---

**11.49.3.82 SetSelectedChannelsQueue() [2/4]** virtual void SetSelectedChannelsQueue (  
    array< bool >^ *selectedChannels*,  
    int *queuesize*,  
    int *threshold*,  
    SampleSizeNet *samplesize*,  
    SampleDstSizeNet *sampleDstSize*,  
    int *ChannelsInBlock* ) [virtual]

**11.49.3.83 SetSelectedChannelsQueue() [3/4]** virtual void SetSelectedChannelsQueue (  
    int *nChannels*,  
    int *queuesize*,  
    int *threshold*,  
    SampleSizeNet *samplesize*,  
    int *ChannelsInBlock* ) [virtual]

Create a common FIFO queue for all channels. Data in callback will be a list per channel. Use ChannelBlock\_↔  
ReadFramesDict... with handle = 0 to read the data.

When using 32 bit data format, ChannelsInBlock is still the number of 16 bit channels per frame, as obtained from GetChannelsInBlock, while nChannels is the number of 32 bit channels to be read from the device. So when all channels from a device are read in 32 bit data format nChannels = ChannelsInBlock/2

**Parameters**

<i>nChannels</i>	Number of channels to be collected in the FIFO.
------------------	---

**Parameters**

<i>queuesize</i>	Size of sample frames the FIFO can hold.
------------------	--

**Parameters**

<i>threshold</i>	Number of sample frames the FIFO must acquire before the callback function is called.
------------------	---

## Parameters

<i>samplesize</i>	size of the datawords, either 16 or 32bit.
-------------------	--

## Parameters

<i>ChannelsInBlock</i>	value obtained from GetChannelsInBlock.
------------------------	---

**11.49.3.84 SetSelectedChannelsQueue()** [4/4] virtual void SetSelectedChannelsQueue (   
     int *nChannels*,  
     int *queuesize*,  
     int *threshold*,  
     SampleSizeNet *samplesize*,  
     SampleDstSizeNet *sampleDstSize*,  
     int *ChannelsInBlock* ) [virtual]

**11.49.3.85 SetSelectedData()** [1/4] virtual void SetSelectedData (   
     array< bool >^ *selectedChannels*,  
     int *queuesize*,  
     int *threshold*,  
     SampleSizeNet *samplesize*,  
     int *ChannelsInBlock* ) [virtual]

Create a common FIFO queue for all channels. Use handle = 0 in the ChannelBlock\_ReadFrames... functions.

When using 32 bit data format, ChannelsInBlock is still the number of 16 bit channels per frame, as obtained from GetChannelsInBlock, while nChannels is the number of 32 bit channels to be read from the device. So when all channels from a device are read in 32 bit data format nChannels = ChannelsInBlock/2

## Parameters

<i>selectedChannels</i>	List of channels to be collected in the FIFO.
-------------------------	---

## Parameters

<i>queuesize</i>	Size of sample frames the FIFO can hold.
------------------	--

## Parameters

<i>threshold</i>	Number of sample frames the FIFO must acquire before the callback function is called.
------------------	---

## Parameters

<i>samplesize</i>	size of the datawords, either 16 or 32bit.
<i>ChannelsInBlock</i>	value obtained from GetChannelsInBlock.

**11.49.3.86 SetSelectedData() [2/4]** virtual void SetSelectedData (   
     array< bool >^ selectedChannels,   
     int queuesize,   
     int threshold,   
     SampleSizeNet samplesize,   
     SampleDstSizeNet sampleDstSize,   
     int ChannelsInBlock ) [virtual]

**11.49.3.87 SetSelectedData() [3/4]** virtual void SetSelectedData (   
     int nChannels,   
     int queuesize,   
     int threshold,   
     SampleSizeNet samplesize,   
     int ChannelsInBlock ) [virtual]

Create a common FIFO queue for all channels. Use handle = 0 in the ChannelBlock\_ReadFrames... functions.

When using 32 bit data format, ChannelsInBlock is still the number of 16 bit channels per frame, as obtained from GetChannelsInBlock, while nChannels is the number of 32 bit channels to be read from the device. So when all channels from a device are read in 32 bit data format nChannels = ChannelsInBlock/2

## Parameters

<i>nChannels</i>	Number of channels to be collected in the FIFO.
------------------	---

## Parameters

<i>queuesize</i>	Size of sample frames the FIFO can hold.
------------------	--

## Parameters

<i>threshold</i>	Number of sample frames the FIFO must acquire before the callback function is called.
------------------	---

## Parameters

<i>samplesize</i>	size of the datawords, either 16 or 32bit.
<i>ChannelsInBlock</i>	value obtained from GetChannelsInBlock.

**11.49.3.88 SetSelectedData()** [4/4] virtual void SetSelectedData (   
     int *nChannels*,   
     int *queuesize*,   
     int *threshold*,   
     SampleSizeNet *samplesize*,   
     SampleDstSizeNet *sampleDstSize*,   
     int *ChannelsInBlock* ) [virtual]

**11.49.3.89 SetupGroupDacqQueue()** [1/2] void SetupGroupDacqQueue (   
     int *queuesize*,   
     int *threshold* )

**11.49.3.90 SetupGroupDacqQueue()** [2/2] void SetupGroupDacqQueue (   
     int *queuesize*,   
     int *threshold*,   
     unsigned int *virtualDevice* )

**11.49.3.91 SetVoltageRangeByIndex()** virtual void SetVoltageRangeByIndex (   
     int32\_t *voltageRangeIndex*,   
     unsigned int *virtualDevice* ) [virtual]

Sets the voltage range on devices which support multiple voltage ranges.

## Parameters

<i>voltageRangeIndex</i>	Voltage Range to use as index, smaller values are larger voltage ranges.
--------------------------	--

**11.49.3.92 SetVoltageRangeInMicroVolt()** `virtual void SetVoltageRangeInMicroVolt (`  
    `int32_t voltageRange,`  
    `unsigned int virtualDevice ) [virtual]`

Sets the voltage range on devices which support multiple voltage ranges.

**Parameters**

<i>voltageRange</i>	Voltage Range to use in $\mu$ V.
---------------------	----------------------------------

This replaces SetVoltageRange, where the value of the range was in mV!

**11.49.3.93 StartDacq()** [1/4] `virtual void StartDacq ( ) [virtual]`

Start the data acquisition thread and sampling.

**11.49.3.94 StartDacq()** [2/4] `virtual void StartDacq (`  
    `int32_t timeout ) [virtual]`

Start the data acquisition thread and sampling.

**Parameters**

<i>timeout</i>	Timeout in ms.
----------------	----------------

**11.49.3.95 StartDacq()** [3/4] `virtual void StartDacq (`  
    `int32_t timeout,`  
    `int32_t numSubmittedUsbBuffers,`  
    `int32_t numUsbBuffers,`  
    `int32_t packetsInUrb ) [virtual]`

Start the data acquisition thread and sampling.

**Parameters**

<i>timeout</i>	Timeout in ms.
----------------	----------------

## Parameters

<i>numSubmittedUsbBuffers</i>	Number of USB Buffers that are simultaneously submitted.
-------------------------------	--

## Parameters

<i>numUsbBuffers</i>	Number of USB Buffers to use.
----------------------	-------------------------------

## Parameters

<i>packetsInUrb</i>	Packets in each URB.
---------------------	----------------------

**11.49.3.96 StartDacq()** [4/4] `virtual void StartDacq (`  
    `int32_t timeout,`  
    `int32_t numSubmittedUsbBuffers,`  
    `int32_t numUsbBuffers,`  
    `int32_t packetsInUrb,`  
    `uint32_t virtualDevice ) [virtual]`

Start the data acquisition thread and sampling.

## Parameters

<i>numSubmittedUsbBuffers</i>	Number of USB Buffers that are simultaneously submitted.
-------------------------------	--

## Parameters

<i>timeout</i>	Timeout in ms.
----------------	----------------

## Parameters

<i>numUsbBuffers</i>	Number of USB Buffers to use.
----------------------	-------------------------------

**Parameters**

<i>packetsInUrb</i>	Packets in each URB.
---------------------	----------------------

**Parameters**

<i>virtualDevice</i>	Virtual Device to start.
----------------------	--------------------------

**11.49.3.97 StartLoop()** [1/4] `virtual void StartLoop ( ) [virtual]`

Start the data acquisition thread.

**11.49.3.98 StartLoop()** [2/4] `virtual void StartLoop (   
int32_t timeout ) [virtual]`

Start the data acquisition thread.

**Parameters**

<i>timeout</i>	Timeout in ms.
----------------	----------------

**11.49.3.99 StartLoop()** [3/4] `virtual void StartLoop (   
int32_t timeout,   
int32_t numSubmittedUsbBuffers,   
int32_t numUsbBuffers,   
int32_t packetsInUrb ) [virtual]`

Start the data acquisition thread.

**Parameters**

<i>timeout</i>	Timeout in ms.
----------------	----------------

**Parameters**

<i>numSubmittedUsbBuffers</i>	Number of USB Buffers that are simultaneously submitted.
-------------------------------	--

## Parameters

<i>numUsbBuffers</i>	Number of USB Buffers to use.
----------------------	-------------------------------

## Parameters

<i>packetsInUrb</i>	Packets in each URB.
---------------------	----------------------

**11.49.3.100 StartLoop()** [4/4] virtual void StartLoop (  
    int32\_t *timeout*,  
    int32\_t *numSubmittedUsbBuffers*,  
    int32\_t *numUsbBuffers*,  
    int32\_t *packetsInUrb*,  
    uint32\_t *virtualDevice* ) [virtual]

Start the data acquisition thread.

## Parameters

<i>numSubmittedUsbBuffers</i>	Number of USB Buffers that are simultaneously submitted.
-------------------------------	--

## Parameters

<i>timeout</i>	Timeout in ms.
----------------	----------------

## Parameters

<i>numUsbBuffers</i>	Number of USB Buffers to use.
----------------------	-------------------------------

## Parameters

<i>packetsInUrb</i>	Packets in each URB.
---------------------	----------------------

**Parameters**

<i>virtualDevice</i>	Virtual Device to start.
----------------------	--------------------------

**11.49.3.101 StopDacq()** [1/2] `virtual void StopDacq ( ) [virtual]`

Stop the data acquisition thread and sampling.

**11.49.3.102 StopDacq()** [2/2] `virtual void StopDacq (   
uint32_t virtualDevice ) [virtual]`

Stop the data acquisition thread and sampling.

**Parameters**

<i>virtualDevice</i>	Virtual Device to start.
----------------------	--------------------------

**11.49.3.103 StopLoop()** `virtual void StopLoop ( ) [virtual]`

**11.49.4 Member Data Documentation**

**11.49.4.1 Error\_Callback\_Aquisition\_Stopped** `const int Error_Callback_Aquisition_Stopped = 0x200 [static]`

**11.49.4.2 Error\_Callback\_Data\_lost** `const int Error_Callback_Data_lost = 5 [static]`

 String^ RawLabel,   
 CFirmwareDestinationNet dest ) [static]

**11.52.2.10 GetDestinationName()** [1/2] `String ^ GetDestinationName ( CFirmwareDestinationNet dest )`

**11.52.2.11 GetDestinationName()** [2/2] `String ^ GetDestinationName ( unsigned int index )`

**11.52.2.12 GetDestinationSerialNumber()** `String ^ GetDestinationSerialNumber ( CFirmwareDestinationNet dest )`

**11.52.2.13 GetDestinationTargetAddress()** `unsigned int GetDestinationTargetAddress ( CFirmwareDestinationNet destination )`

Gets the target base address for the destination.

#### Parameters

<i>destination</i>	The destination to be queried.
--------------------	--------------------------------

#### Returns

The base address as a 32 bit number, only the lower 16 bit represent the address.

**11.52.2.14 GetFirmwareVersionFromFile()** [1/2] `static bool GetFirmwareVersionFromFile ( String^ FirmwareFile, [System::Runtime::InteropServices::Out] uint32_t% Version ) [static]`

Retrives version info from a Firmware update file.

**11.52.2.15 GetFirmwareVersionFromFile()** [2/2] `static bool GetFirmwareVersionFromFile ( String^ FirmwareFile, [System::Runtime::InteropServices::Out] uint32_t% Version, [System::Runtime::InteropServices::Out] uint32_t% Position ) [static]`

**11.52.2.16 GetFirmwareVersionFromHexFile()** `static bool GetFirmwareVersionFromHexFile ( String^ FirmwareFile, [System::Runtime::InteropServices::Out] uint32_t% Version ) [static]`

**11.52.2.17 GetNumDestinations()** `unsigned int GetNumDestinations ( )`

**11.52.2.18 GetUSBDeviceIDFromFX3Image()** `static uint32_t GetUSBDeviceIDFromFX3Image ( String^ FirmwareFile ) [static]`

**11.52.2.19 GetUsercodeFromBitFile()** `static bool GetUsercodeFromBitFile ( String^ FirmwareFile, [System::Runtime::InteropServices::Out] unsigned int% Usercode ) [static]`

**11.52.2.20 GetUsercodeFromFlash()** `bool GetUsercodeFromFlash ( unsigned int FPGA, unsigned int Address, [System::Runtime::InteropServices::Out] unsigned int% Usercode )`

**11.52.2.21 GetXilinxFlashOffset()** `int32_t GetXilinxFlashOffset ( CFirmwareDestinationNet dest )`

**11.52.2.22 GetXilinxFlashReadCommand()** `uint32_t GetXilinxFlashReadCommand ( CFirmwareDestinationNet dest )`

**11.52.2.23 LoadUserFirmware()** [1/2] `bool LoadUserFirmware ( String^ FirmwareFile, CMcsUsbListEntryNet^ listEntry )`

Send the DSP Firmware to the MEA21 device.

#### Parameters

<i>FirmwareFile</i>	Filename of the DSP Firmware (*.bin) file.
---------------------	--

#### Parameters

<i>listEntry</i>	Device to use for the connection. See <a href="#">CMcsUsbListNet</a> .
------------------	--

**11.52.2.24 LoadUserFirmware()** [2/2] `bool LoadUserFirmware (`  
    `String^ FirmwareFile,`  
    `CMcsUsbListEntryNet^ listEntry,`  
    `uint32_t LockMask )`

**11.52.2.25 ReadBlockFromFlash()** [1/2] `array<unsigned char> ^ ReadBlockFromFlash (`  
    `unsigned int FPGA,`  
    `unsigned int Address )`

**11.52.2.26 ReadBlockFromFlash()** [2/2] `void ReadBlockFromFlash (`  
    `unsigned int FPGA,`  
    `unsigned int Address,`  
    `array< unsigned char >^ buffer,`  
    `int position )`

**11.52.2.27 ReadBlockFromIFBGlobalEEProm()** `array<unsigned char> ^ ReadBlockFromIFBGlobal↵`  
`EEProm (`  
    `unsigned int Address )`

**11.52.2.28 ReadBlockFromNVMEM()** `array<unsigned char> ^ ReadBlockFromNVMEM (`  
    `unsigned int FPGA,`  
    `unsigned int Offset,`  
    `unsigned int Address )`

**11.52.2.29 SetDestinationSerialNumber()** `void SetDestinationSerialNumber (`  
    `CFirmwareDestinationNet dest,`  
    `String^ serialnumber )`

**11.52.2.30 UpdateFirmware()** [1/5] `bool UpdateFirmware (`  
    `String^ FirmwareFile,`  
    `CMcsUsbListEntryNet^ listEntry,`  
    `CFirmwareDestinationNet dest )`

Flashes a firmware file to the device.

## Parameters

<i>FirmwareFile</i>	Filename of the Firmware file.
---------------------	--------------------------------

## Parameters

<i>listEntry</i>	Device to use for the connection.
------------------	-----------------------------------

**11.52.2.31 UpdateFirmware()** [2/5] `bool UpdateFirmware (`  
    `String^ FirmwareFile,`  
    `CMcsUsbListEntryNet^ listEntry,`  
    `CFirmwareDestinationNet dest,`  
    `bool SkipWait )`

Flashes a firmware file to the device.

## Parameters

<i>FirmwareFile</i>	Filename of the Firmware file.
---------------------	--------------------------------

## Parameters

<i>listEntry</i>	Device to use for the connection.
------------------	-----------------------------------

**11.52.2.32 UpdateFirmware()** [3/5] `bool UpdateFirmware (`  
    `String^ FirmwareFile,`  
    `CMcsUsbListEntryNet^ listEntry,`  
    `CFirmwareDestinationNet dest,`  
    `bool SkipWait,`  
    `uint32_t LockMask )`

**11.52.2.33 UpdateFirmware()** [4/5] `bool UpdateFirmware (`  
    `String^ FirmwareFile,`  
    `CMcsUsbListEntryNet^ listEntry,`  
    `CFirmwareDestinationNet Dest,`

```

    OnUpdateFirmwareStatusChange^ deleg,
    OnUpdateFirmwareProgress^ progress,
    bool SkipWait )

```

Flashes a firmware file to the device.

#### Parameters

<i>FirmwareFile</i>	Filename of the Firmware file.
---------------------	--------------------------------

```

11.52.2.34 UpdateFirmware() [5/5] bool UpdateFirmware (
    String^ FirmwareFile,
    CMcsUsbListEntryNet^ listEntry,
    CFirmwareDestinationNet Dest,
    OnUpdateFirmwareStatusChange^ deleg,
    OnUpdateFirmwareProgress^ progress,
    bool SkipWait,
    unsigned int LockMask )

```

*The serial number of the device represented by this `CMcsUsbListEntryNet`.*
- String^ `HwVersion` [get]  
*The hardware revision of the device represented by this `CMcsUsbListEntryNet`.*
- `DeviceIdNet^ DeviceId` [get]

### 11.55.1 Detailed Description

`McsUsbListEntryNet` identifies a connected device.

### 11.55.2 Constructor & Destructor Documentation

#### 11.55.2.1 `~CMcsUsbListEntryNet()` `~CMcsUsbListEntryNet ()`

### 11.55.3 Member Function Documentation

**11.55.3.1 Equals()** `virtual bool Equals ( Object^ obj ) [override], [virtual]`

Checks weather two [CMcsUsbListEntryNet](#) represent the same USB device.

**Parameters**

<i>obj</i>	The <a href="#">CMcsUsbListEntryNet</a> to compare with.
------------	--

**11.55.3.2 GetEntry()** [1/3] `static CMcsUsbListEntryNet ^ GetEntry ( ) [static]`

Returns one [CMcsUsbListEntryNet](#) from the list of USB Devices connected to the computer.

**Returns**

A [CMcsUsbListEntryNet](#) to be used to connect to the device.

**11.55.3.3 GetEntry()** [2/3] `static CMcsUsbListEntryNet ^ GetEntry (   
 DeviceEnumNet McsUsbDevice ) [static]`

Returns one [CMcsUsbListEntryNet](#) from the list of USB Devices connected to the computer.

**Parameters**

<i>McsUsbDevice</i>	Specifies the type of devices to look for.
---------------------	--

**Returns**

A [CMcsUsbListEntryNet](#) to be used to connect to the device.

**11.55.3.4 GetEntry()** [3/3] `static CMcsUsbListEntryNet ^ GetEntry (   
 DeviceEnumNet McsUsbDevice,   
 unsigned int index ) [static]`

Returns one [CMcsUsbListEntryNet](#) from the list of USB Devices connected to the computer.

**Parameters**

<i>McsUsbDevice</i>	Specifies the type of devices to look for.
---------------------	--

## Parameters

<i>index</i>	number of the entry to use.
--------------	-----------------------------

## Returns

A [CMcsUsbListEntryNet](#) to be used to connect to the device.

**11.55.3.5 GetEntryCount()** [1/2] `static unsigned int GetEntryCount ( ) [static]`

Returns the number of devices connected to the computer.

## Returns

The number of devices.

**11.55.3.6 GetEntryCount()** [2/2] `static unsigned int GetEntryCount (   
DeviceEnumNet McsUsbDevice ) [static]`

Returns the number of devices connected to the computer.

## Parameters

<i>McsUsbDevice</i>	Specifies the type of devices to look for.
---------------------	--

## Returns

The number of devices.

**11.55.3.7 SetStringFormat()** `void SetStringFormat (   
String ^ format )`

Specify the text the [CMcsUsbListEntryNet.ToString\(\)](#) function should return. The special code N expands to the device name and S expands to the serial number of the device.

**Parameters**

<i>format</i>	A String containing the format template. Default is "%N (%S)".
---------------	--

**11.55.3.8 ToString()** `virtual String ^ ToString ( ) [override], [virtual]`

**11.55.4 Property Documentation**

**11.55.4.1 DeviceId** `DeviceIdNet^ DeviceId [get]`

**11.55.4.2 DeviceName** `String^ DeviceName [get]`

The device name of the device represented by this [CMcsUsbListEntryNet](#).

**11.55.4.3 HwVersion** `String^ HwVersion [get]`

The hardware revision of the device represented by this [CMcsUsbListEntryNet](#).

**11.55.4.4 Manufacturer** `String^ Manufacturer [get]`

The Manufacturer ID of the device represented by this [CMcsUsbListEntryNet](#).

**11.55.4.5 Product** `String^ Product [get]`

The Product ID of the device represented by this [CMcsUsbListEntryNet](#).

**11.55.4.6 SerialNumber** `String^ SerialNumber [get]`

The serial number of the device represented by this [CMcsUsbListEntryNet](#).

## 11.56 CMcsUsbListNet Class Reference

Class to handle a list of connected MCS USB devices.

### Public Member Functions

- [CMcsUsbListNet](#) ([DeviceEnumNet](#) McsUsbDevice)

#### 11.56.1 Detailed Description

Class to handle a list of connected MCS USB devices.

#### 11.56.2 Constructor & Destructor Documentation

##### 11.56.2.1 CMcsUsbListNet() [1/2] [CMcsUsbListNet](#) ( [DeviceEnumNet](#) McsUsbDevice )

Initializes a new instance of [CMcsUsbListNet](#) class.

**11.56.2.2 CMcsUsbListNet()** [2/2] `CMcsUsbListNet (`  
`array< DeviceIdNet^>^ DeviceIdList )`

Initializes a new instance of `CMcsUsbListNet` class.

**11.56.2.3 ~CMcsUsbListNet()** `~CMcsUsbListNet ( )`

Destructor: called by `Dispose()`

**11.56.2.4 ~!CMcsUsbListNet()** `!CMcsUsbListNet ( )`

Finalizer: called by GC before collecting

### 11.56.3 Member Function Documentation

**11.56.3.1 GetNumberOfDevices()** `uint32_t GetNumberOfDevices ( )`

Gets the number of devices currently in the list.

#### Returns

The number of devices currently in the list.

**11.56.3.2 GetUsbListEntries()** `array<CMcsUsbListEntryNet^> ^ GetUsbListEntries ( )`

Returns all entries from the list of USB Devices connected to the computer.

**11.56.3.3 GetUsbListEntry()** `CMcsUsbListEntryNet ^ GetUsbListEntry (`  
`unsigned int index )`

Returns one `CMcsUsbListEntryNet` from the list of USB Devices connected to the computer.

#### Parameters

<i>index</i>	number of the entry to use.
--------------	-----------------------------

**11.56.3.4 IsDeviceTypeOf()** `bool IsDeviceTypeOf (`  
     `CMcsUsbListEntryNet^ entry,`  
     `DeviceEnumNet McsUsbDevice )`

**11.56.3.5 SetStringFormat()** `void SetStringFormat (`  
     `String ^ format )`

Specify the text the [CMcsUsbListEntryNet.ToString\(\)](#) function should return. The special code N expands to the device name and S expands to the serial number of the device.

Parameters

<i>format</i>	A String containing the format template. Default is "%N (%S)".
---------------	--

## 11.56.4 Property Documentation

**11.56.4.1 Count** `uint32_t Count [get]`

Gets the number of devices currently in the list.

## 11.56.5 Event Documentation

**11.56.5.1 DeviceArrival** `OnDeviceArrivalRemoval^ DeviceArrival`

**11.56.5.2 DeviceRemoval** `OnDeviceArrivalRemoval^ DeviceRemoval`

## 11.57 CMcsUsbNet Class Reference

Base class to handle MCS USB devices. All device classes are derived from this class. Functionality that is provided by all MCS devices is handled by this class.

Inheritance diagram for CMcsUsbNet:

### Properties

- virtual String^ [SerialNumber](#) [get]

### 11.57.1 Detailed Description

Base class to handle MCS USB devices. All device classes are derived from this class. Functionality that is provided by all MCS devices is handled by this class.

### 11.57.2 Constructor & Destructor Documentation

#### 11.57.2.1 **CMcsUsbNet()** [1/2] `CMcsUsbNet ( )`

Initializes a new instance of the base class to handle MCS USB devices.

#### 11.57.2.2 **CMcsUsbNet()** [2/2] `CMcsUsbNet ( McsBusTypeEnumNet bustype )`

Initializes a new instance of the base class to handle MCS USB devices.

Parameters

<i>bustype</i>	Type of device to use, either USB or PCI.
----------------	---

#### 11.57.2.3 **~CMcsUsbNet()** `virtual ~CMcsUsbNet ( ) [virtual]`

#### 11.57.2.4 **"!CMcsUsbNet()** `!CMcsUsbNet ( )`

### 11.57.3 Member Function Documentation

#### 11.57.3.1 **AddSoftwareKey()** `void AddSoftwareKey ( String^ key )`

#### 11.57.3.2 **AssociateToThis()** `void AssociateToThis ( CMcsUsbNet^ device )`

**11.57.3.3 Connect()** [1/4] `virtual uint32_t Connect ( ) [virtual]`

Opens a connection to the device.

**Returns**

Error Status. 0 on success.

**11.57.3.4 Connect()** [2/4] `virtual uint32_t Connect ( CMcsUsbListEntryNet^ entry ) [virtual]`

Opens a connection to the device.

**Parameters**

<i>entry</i>	The Device List Entry for the device to be connected.
--------------	---

**Returns**

Error Status. 0 on success.

**11.57.3.5 Connect()** [3/4] `virtual uint32_t Connect ( CMcsUsbListEntryNet^ entry, unsigned int LockMask ) [virtual]`

Opens a connection to the device.

**Parameters**

<i>entry</i>	The Device List Entry for the device to be connected.
<i>LockMask</i>	The Lock Mask for this connection.

**Returns**

Error Status. 0 on success.

**11.57.3.6 Connect()** [4/4] `virtual uint32_t Connect ( unsigned int LockMask ) [virtual]`

Opens a connection to the device.

**Parameters**

<i>LockMask</i>	The Lock Mask for this connection.
-----------------	------------------------------------

**Returns**

Error Status. 0 on success.

**11.57.3.7 CyclePort()** `uint32_t CyclePort ( )`

**11.57.3.8 Disconnect()** `virtual void Disconnect ( ) [virtual]`

Disconnect from a device.

**11.57.3.9 EmptyKey()** `bool EmptyKey (`  
    `String^ key )`

**11.57.3.10 EnableExceptions()** `void EnableExceptions (`  
    `bool enable )`

Enables or Disables Exceptions for calls to McsUsb Devices. If Exceptions are disabled, the return value of a command can be queries with the `GetStatusOfLastCommand` call instead.

**Parameters**

<i>enable</i>	True to enable Exceptions, False to disable.
---------------	--

**11.57.3.11 EraseEepromRegisterPreconfig() [1/3]** `void EraseEepromRegisterPreconfig (`  
    `uint32_t EEPROMBase,`  
    `uint32_t DMA_reg )`

**11.57.3.12 EraseEepromRegisterPreconfig() [2/3]** `void EraseEepromRegisterPreconfig (`  
    `uint32_t EEPROMBase,`  
    `uint32_t DMA_reg,`  
    `uint32_t EEPROMSize )`

**11.57.3.13 EraseEepromRegisterPreconfig()** [3/3] `void EraseEepromRegisterPreconfig (`  
    `uint32_t EEPROMBase,`  
    `uint32_t DMA_reg,`  
    `uint32_t EEPROMSize,`  
    `uint32_t EepromStartAddress )`

**11.57.3.14 GetConfiguration()** `uint8_t GetConfiguration ( )`

**11.57.3.15 GetDeviceCannotStallOutRequests()** `bool GetDeviceCannotStallOutRequests ( )`

**11.57.3.16 GetDeviceCapableSpeed()** `McsUsbSpeedEnumNet GetDeviceCapableSpeed ( )`

**11.57.3.17 GetDeviceEnum()** `DeviceEnumNet GetDeviceEnum ( )`

**11.57.3.18 GetDeviceId()** `DeviceIdNet ^ GetDeviceId ( )`

**11.57.3.19 GetDeviceRootHubVendorEnum()** `UsbVendorIdEnumNet GetDeviceRootHubVendorEnum ( )`

Gets the Vendor ID of the USB root hub the device is connected to.

#### Returns

An enum which enumerates the PCI Vendor ID.

**11.57.3.20 GetDeviceRootHubVendorID()** `uint32_t GetDeviceRootHubVendorID ( )`

Gets the Vendor ID of the USB root hub the device is connected to.

#### Returns

The PCI Vendor ID, 0x8086 for Intel, 0x1912 for Renesas, 0x1b21 for ASMedia.

**11.57.3.21 GetDeviceRootHubVendorName()** `String ^ GetDeviceRootHubVendorName ( )`

Gets the Vendor Name of the USB root hub the device is connected to.

**Returns**

The PCI Vendor Name, either "Intel", "Renesas", "ASMedia" or "unknown".

**11.57.3.22 GetDeviceSpeed()** `McsUsbSpeedEnumNet GetDeviceSpeed ( )`

Query the Connection Speed of the device.

**Returns**

0 for Low-Speed, 1 for Full-Speed, 2 for High-Speed and 3 for SuperSpeed.

**11.57.3.23 GetErrorText()** `static String ^ GetErrorText ( unsigned int Status ) [static]`

Gets the error text string that belongs to a status number.

**Parameters**

<i>Status</i>	The status number you want the text for.
---------------	--

**Returns**

The error text string that belongs to the status number.

**11.57.3.24 GetFirmwareVersion()** `unsigned int GetFirmwareVersion ( CFirmwareDestinationNet destination )`

Gets the firmware version for the destination.

**Parameters**

<i>destination</i>	The destination to be queried.
--------------------	--------------------------------

**Returns**

The firmware version as a 32 bit number, the upper 16 bit contain the major version number, the lower 16 bit the minor version number.

**11.57.3.25 GetHardwareRevision()** `String ^ GetHardwareRevision ( )`

**11.57.3.26 GetHeadstageActive()** `bool GetHeadstageActive (   
 uint32_t headstage )`

queries whether a headstage is active

**Parameters**

in	<i>headstage</i>	the headstage number (0 or 1)
----	------------------	-------------------------------

**Returns**

true if the headstage is active

**11.57.3.27 GetHeadstageID()** `HeadstageIdEnumNet GetHeadstageID (   
 uint32_t headstage )`

Gets the ID of a connected headstage.

**Parameters**

in	<i>headstage</i>	the headstage number (0 or 1)
----	------------------	-------------------------------

**Returns**

enumerated Headstage ID

**11.57.3.28 GetHeadstagePresent()** `bool GetHeadstagePresent (   
 uint32_t headstage )`

queries whether a headstage is present

**Parameters**

in	<i>headstage</i>	the headstage number (0 or 1)
----	------------------	-------------------------------

**Returns**

true if the headstage is present

**11.57.3.29 GetIdent()** `uint32_t GetIdent ( [System::Runtime::InteropServices::Out] String^% Answer )`

**11.57.3.30 GetLastUSBError()** `unsigned int GetLastUSBError ( )`

**11.57.3.31 GetMea21UsbPort()** `uint32_t GetMea21UsbPort ( )`

Gets the USB port if an IFB that is used by this connection

Returns

number of used port; range: 0..1

**11.57.3.32 GetNumConfigurations()** `uint8_t GetNumConfigurations ( )`

**11.57.3.33 GetSerialNumber()** `virtual String ^ GetSerialNumber ( ) [virtual]`

Query the Serial Number of the device.

Returns

The Serial Number.

**11.57.3.34 GetSoftwareKey()** `array<BYTE> ^ GetSoftwareKey ( unsigned int index )`

**11.57.3.35 GetSoftwareKeyString() [1/2]** `String ^ GetSoftwareKeyString ( SoftwareKeyProgrammIdsNet::ProgrammIdsNet ProgrammID, uint8_t majorversion )`

**11.57.3.36 GetSoftwareKeyString() [2/2]** `String ^ GetSoftwareKeyString ( uint8_t ProgrammID, uint8_t majorversion )`

**11.57.3.37 GetStatus()** virtual uint32\_t GetStatus (   
 [System::Runtime::InteropServices::Out] uint32\_t% iStatus ) [virtual]

**11.57.3.38 GetStatusOfLastCommand()** uint32\_t GetStatusOfLastCommand ( )

Gets the status of the last call to the McsUsb Library.

#### Returns

The Error Status of the last McsUsb command. 0 on success.

**11.57.3.39 GetUsbListEntry()** CMcsUsbListEntryNet ^ GetUsbListEntry ( )

**11.57.3.40 GetVersion()** [1/2] DriverVersionNet ^ GetVersion ( )

**11.57.3.41 GetVersion()** [2/2] DriverVersionNet ^ GetVersion (   
 CFirmwareDestinationNet dest )

**11.57.3.42 HasSoftwareKey()** [1/2] bool HasSoftwareKey (   
 SoftwareKeyProgrammIdsNet::ProgrammIdsNet ProgrammID,   
 uint8\_t majorversion )

**11.57.3.43 HasSoftwareKey()** [2/2] bool HasSoftwareKey (   
 uint8\_t ProgrammID,   
 uint8\_t majorversion )

**11.57.3.44 IsConnected()** virtual bool IsConnected ( ) [virtual]

Check if a device is Connected.

#### Returns

true if the device is connected.

**11.57.3.45 IsDeviceHighSpeed()** `bool IsDeviceHighSpeed ( )`

**11.57.3.46 IsDeviceHighSpeedCapable()** `bool IsDeviceHighSpeedCapable ( )`

**11.57.3.47 IsExceptionsEnabled()** `bool IsExceptionsEnabled ( )`

**11.57.3.48 MultibootGetCypressImageId()** `uint32_t MultibootGetCypressImageId ( unsigned int sector )`

Query the multiboot image id of the device located in specified sector (range: 0..9 0..9) of IFB2 Cypress.

**Returns**

The magic ident code of the image.

**11.57.3.49 MultibootGetImageId()** `String ^ MultibootGetImageId ( unsigned int sector )`

Query the multiboot image id of the device located in specified sector (range: 0..2 / 0..9) of IFB1 / IFB2 FPGA.

**Returns**

The magic ident code of the image.

**11.57.3.50 MultibootGetSelectedImage()** `uint32_t MultibootGetSelectedImage ( )`

Gets sector index of selected FPGA boot image on IFB

**Returns**

Sector index of image; range: 0..2

**11.57.3.51 MultibootSelectImage()** `void MultibootSelectImage ( unsigned int sector )`

Select the multiboot image specified by "sector" (range: 0..2) for IFB FPGA.

#### Returns

Throws exception on error.

**11.57.3.52 ReadEepromRegisterPreconfig() [1/3]** `bool ReadEepromRegisterPreconfig ( uint32_t EEPROMBase, uint32_t DMA_reg, [System::Runtime::InteropServices::Out] uint32_t% DMA_value )`

**11.57.3.53 ReadEepromRegisterPreconfig() [2/3]** `bool ReadEepromRegisterPreconfig ( uint32_t EEPROMBase, uint32_t DMA_reg, [System::Runtime::InteropServices::Out] uint32_t% DMA_value, uint32_t EEPROMSize )`

**11.57.3.54 ReadEepromRegisterPreconfig() [3/3]** `bool ReadEepromRegisterPreconfig ( uint32_t EEPROMBase, uint32_t DMA_reg, [System::Runtime::InteropServices::Out] uint32_t% DMA_value, uint32_t EEPROMSize, uint32_t EepromStartAddress )`

**11.57.3.55 ReadRegister() [1/2]** `unsigned int ReadRegister ( unsigned int reg )`

**11.57.3.56 ReadRegister() [2/2]** `array<uint32_t> ^ ReadRegister ( unsigned int reg, int length )`

**11.57.3.57 ReadRegister32()** `unsigned int ReadRegister32 ( unsigned int adr )`

**11.57.3.58 ReadRegisterTimeSlot()** unsigned int ReadRegisterTimeSlot (   
 unsigned int *reg*,  
 int *TimeSlot* )

**11.57.3.59 RemoveSoftwareKey()** void RemoveSoftwareKey (   
 unsigned int *index* )

**11.57.3.60 RescanHeadstage()** void RescanHeadstage (   
 uint32\_t *headstage* )

rescans and activates a headstage

**Parameters**

in	<i>headstage</i>	the headstage number (0 or 1)
----	------------------	-------------------------------

### 11.60.3 Member Function Documentation

**11.60.3.1 GetLayoutConfiguration()** `StimulationLayoutConfigurationEnumNet GetLayoutConfiguration ( )`

Gets the stimulation layout configuration. Can be single well, 6-well or 9-well. The number of DAC channels available per well is `Mcs::Usb::CStg200xBasicNet::GetNumberOfAnalogChannels` divided by `Mcs::Usb::CStg200xBasicNet::GetNumberOfStimulationSourcesPerElectrode`.

#### Returns

The currently active stimulation layout configuration.

**11.60.3.2 SetLayoutConfiguration()** `void SetLayoutConfiguration ( StimulationLayoutConfigurationEnumNet LayoutConfiguration )`

Sets the stimulation layout configuration. Can be single well, 6-well or 9-well. The number of DAC channels available per well is `Mcs::Usb::CStg200xBasicNet::GetNumberOfAnalogChannels` divided by `Mcs::Usb::CStg200xBasicNet::GetNumberOfStimulationSourcesPerElectrode`.

#### Parameters

<i>LayoutConfiguration</i>	The new stimulation layout configuration.
----------------------------	---

### 11.61.2 Member Function Documentation

**11.61.2.1 GetAudioChannels()** [1/2] virtual uint32\_t GetAudioChannels (  
[System::Runtime::InteropServices::Out] array< [s\\_setaudionet](#)<sup>^</sup>>% channels )  
[virtual]

Gets the electrode to monitor and amplification for the audio channels.

## Parameters

<i>channels</i>	Struct which contains the electrode (channel) and amplification on return.
-----------------	--

## Returns

Error Status. 0 on success.

**11.61.2.2 GetAudioChannels() [2/2]** `virtual uint32_t GetAudioChannels ( [System::Runtime::InteropServices::Out] array< s\_setaudionet>^% channels, unsigned int virtualDevice ) [virtual]`

Gets the electrode to monitor and amplification for the audio channels.

## Parameters

<i>channels</i>	Struct which contains the electrode (channel) and amplification on return.
-----------------	--

## Parameters

<i>virtualDevice</i>	Virtual device to use.
----------------------	------------------------

## Returns

Error Status. 0 on success.

**11.61.2.3 GetNumberOfAudioChannels()** `virtual uint32_t GetNumberOfAudioChannels ( ) [virtual]`

Gets the number of available audio channels.

## Returns

The number of audio channels available, 0 when there are none.

**11.61.2.4 SetAudioChannels() [1/2]** `virtual uint32_t SetAudioChannels ( array< s\_setaudionet>^ channels ) [virtual]`

Sets the electrode to monitor and amplification for the audio channels.

**Parameters**

<i>channels</i>	Struct which defines the electrode (channel) and amplification.
-----------------	---

**Returns**

Error Status. 0 on success.

**11.61.2.5 SetAudioChannels()** [2/2] `virtual uint32_t SetAudioChannels (`  
    `array< s\_setaudionet>> channels,`  
    `unsigned int virtualDevice ) [virtual]`

Sets the electrode to monitor and amplification for the audio channels.

**Parameters**

<i>channels</i>	Struct which defines the electrode (channel) and amplification.
-----------------	---

**Parameters**

<i>virtualDevice</i>	Virtual device to use.
----------------------	------------------------

**Returns**

Error Status. 0 on success.

*Gets the output voltage.*
- int32\_t [GetCycle](#) ()  
*Gets the current cycle.*

## Additional Inherited Members

### 11.62.1 Detailed Description

[CMeaCleanDeviceNet](#) is the class to access the MEA Clean device.

### 11.62.2 Constructor & Destructor Documentation

#### 11.62.2.1 CMeaCleanDeviceNet() [CMeaCleanDeviceNet](#) ( )

Initializes a new instance of the [CMeaCleanDeviceNet](#) class.

**11.62.2.2** `~CMeaCleanDeviceNet()` `virtual ~CMeaCleanDeviceNet ( ) [virtual]`

**11.62.2.3** `!CMeaCleanDeviceNet()` `!CMeaCleanDeviceNet ( )`

### 11.62.3 Member Function Documentation

**11.62.3.1** `GetCycle()` `int32_t GetCycle ( )`

Gets the current cycle.

#### Returns

The cycle number.

**11.62.3.2** `GetCycles()` `uint32_t GetCycles ( )`

Gets the number of cycles.

#### Returns

The number of cycles to run for.

**11.62.3.3** `GetMaxVoltage()` `int32_t GetMaxVoltage ( )`

Gets the upper voltage level

#### Returns

The upper voltage level in mV.

**11.62.3.4** `GetMinVoltage()` `int32_t GetMinVoltage ( )`

Gets the lower voltage level.

#### Returns

The lower voltage level in mV.

**11.62.3.5 GetOutputVoltage()** `int32_t GetOutputVoltage ( )`

Gets the output voltage.

**Returns**

The output voltage in mV.

**11.62.3.6 GetSlope()** `uint32_t GetSlope ( )`

Gets the voltage slope.

**Returns**

The voltage slope in mV/s.

**11.62.3.7 IsRunning()** `bool IsRunning ( )`

Gets if the MEA Clean device is running.

**Returns**

"true" when a run is in progress, otherwise "false".

**11.62.3.8 SetCycles()** `void SetCycles (   
uint32_t cycles )`

Sets the number of cycles.

**Parameters**

<i>cycles</i>	The number of cycles to run for (0 .. 99).
---------------	--

**11.62.3.9 SetMaxVoltage()** `void SetMaxVoltage (   
int32_t voltageMax )`

Sets the upper voltage level.

**Parameters**

<i>voltageMax</i>	The upper voltage level in mV (-1.6 .. 1.6 V).
-------------------	--

**11.62.3.10 SetMinVoltage()** `void SetMinVoltage (`  
    `int32_t voltageMin )`

Sets the lower voltage level.

**Parameters**

<i>voltageMin</i>	The lower voltage level in mV (-1.6 .. 1.6 V).
-------------------	--

**11.62.3.11 SetSlope()** `void SetSlope (`  
    `uint32_t voltageSlope )`

Sets the voltage slope.

**Parameters**

<i>voltageSlope</i>	The voltage slope in mV/s (range 0 .. 60 V/s).
---------------------	--

**11.62.3.12 Start()** `void Start ( )`

Starts a MEA Clean run.

**11.62.3.13 Stop()** `void Stop ( )`

Stops a MEA Clean run.

## 11.63 CMeaCoatDeviceNet Class Reference

[CMeaCoatDeviceNet](#) is the class to access the MEA Coat device.

Inheritance diagram for CMeaCoatDeviceNet:

## Public Member Functions

- [CMeaCoatDeviceNet](#) ()  
*Initializes a new instance of the [CMeaCoatDeviceNet](#) class.*
- virtual [~CMeaCoatDeviceNet](#) ()
- [!CMeaCoatDeviceNet](#) ()

*Gets the offset of the current.*
- int32\_t [GetOutputCurrent](#) ()  
*Gets the output current.*
- int32\_t [GetTimeInPlateau](#) ()  
*Gets the time in the plateau.*
- void [SetPauseDuration](#) (uint32\_t pauseDuration)  
*Sets the duration of the pause between MEA Coat pulses.*
- uint32\_t [GetPauseDuration](#) ()  
*Gets the duration of the pause between MEA Coat pulses.*
- int32\_t [GetTimeInPause](#) ()  
*Gets the time in the pause.*
- void [SetCycles](#) (uint32\_t cycles)  
*Sets the number of cycles.*
- uint32\_t [GetCycles](#) ()  
*Gets the number of cycles.*
- int32\_t [GetCurrentCycle](#) ()  
*Gets the current cycle.*

## Additional Inherited Members

### 11.63.1 Detailed Description

[CMeaCoatDeviceNet](#) is the class to access the MEA Coat device.

### 11.63.2 Constructor & Destructor Documentation

#### 11.63.2.1 CMeaCoatDeviceNet() `CMeaCoatDeviceNet ( )`

Initializes a new instance of the `CMeaCoatDeviceNet` class.

#### 11.63.2.2 ~CMeaCoatDeviceNet() `virtual ~CMeaCoatDeviceNet ( ) [virtual]`

#### 11.63.2.3 "!CMeaCoatDeviceNet() `!CMeaCoatDeviceNet ( )`

### 11.63.3 Member Function Documentation

#### 11.63.3.1 GetCurrentCycle() `int32_t GetCurrentCycle ( )`

Gets the current cycle.

##### Returns

The cycle number.

#### 11.63.3.2 GetCycles() `uint32_t GetCycles ( )`

Gets the number of cycles.

##### Returns

The number of cycles to run for.

#### 11.63.3.3 GetDuration() `uint32_t GetDuration ( )`

Gets the duration of a MEA Coat run.

##### Returns

The duration in ms.

**11.63.3.4 GetMaxCurrent()** `uint32_t GetMaxCurrent ( )`

Gets the limit of the current ramp (absolute value).

**Returns**

The limit of the current ramp in pA (absolute value).

**11.63.3.5 GetOffsetCurrent()** `int32_t GetOffsetCurrent ( )`

Gets the offset of the current.

**Returns**

The offset of the current in pA.

**11.63.3.6 GetOutputCurrent()** `int32_t GetOutputCurrent ( )`

Gets the output current.

**Returns**

The output current in pA.

**11.63.3.7 GetPauseDuration()** `uint32_t GetPauseDuration ( )`

Gets the duration of the pause between MEA Coat pulses.

**Returns**

The duration in ms.

**11.63.3.8 GetSlope()** `int32_t GetSlope ( )`

Gets the current slope.

**Returns**

The current slope in pA/s.

**11.63.3.9 GetTimeInPause()** `int32_t GetTimeInPause ( )`

Gets the time in the pause.

**Returns**

The time in the pause in ms.

**11.63.3.10 GetTimeInPlateau()** `int32_t GetTimeInPlateau ( )`

Gets the time in the plateau.

**Returns**

The time in the plateau in ms.

**11.63.3.11 IsRunning()** `bool IsRunning ( )`

Gets if the MEA Clean device is running.

**Returns**

"true" when a run is in progress, otherwise "false".

**11.63.3.12 SetCycles()** `void SetCycles (   
uint32_t cycles )`

Sets the number of cycles.

**Parameters**

<i>cycles</i>	The number of cycles to run for (0 .. 99).
---------------	--

**11.63.3.13 SetDuration()** `void SetDuration (   
uint32_t duration )`

Sets the duration of a MEA Coat run.

**Parameters**

<i>duration</i>	The duration in ms (range 0 .. 65 s).
-----------------	---------------------------------------

**11.63.3.14 SetMaxCurrent()** `void SetMaxCurrent (`  
    `uint32_t currentMax )`

Sets the limit of the current ramp (absolute value).

**Parameters**

<i>currentMax</i>	The limit of the current ramp in pA (absolute value, 0 .. 18 nA).
-------------------	---

**11.63.3.15 SetOffsetCurrent()** `void SetOffsetCurrent (`  
    `int32_t currentOffset )`

Sets the offset of the current.

**Parameters**

<i>currentOffset</i>	The offset of the current in pA (-10 .. 10 nA).
----------------------	---

**11.63.3.16 SetPauseDuration()** `void SetPauseDuration (`  
    `uint32_t pauseDuration )`

Sets the duration of the pause between MEA Coat pulses.

**Parameters**

<i>pauseDuration</i>	The duration in ms (range 0 .. 65 s).
----------------------	---------------------------------------

**11.63.3.17 SetSlope()** `void SetSlope (`  
    `int32_t currentSlope )`

Sets the current slope.

**Parameters**

<i>currentSlope</i>	The current slope in pA/s (range -65 .. 65 nA/s).
---------------------	---

**11.63.3.18 Start()** `void Start ( )`

Starts a MEA Coat run.

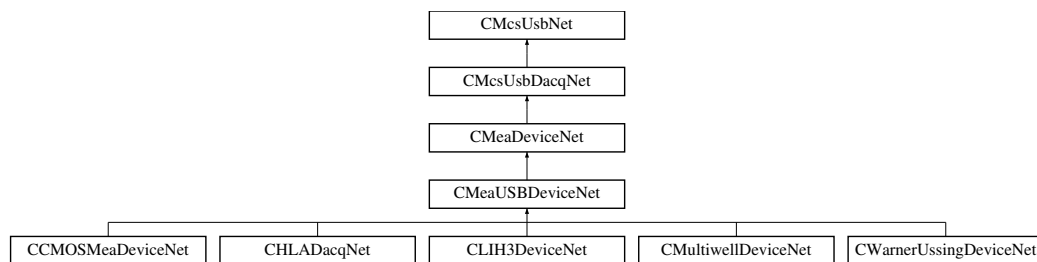

### 11.63.3.19 Stop() void Stop ( )

Stops a MEA Coat run.

## 11.64 CMeaDeviceNet Class Reference

Base class for MEA data acquisition devices.

Inheritance diagram for CMeaDeviceNet:

### Public Member Functions

## Additional Inherited Members

### 11.64.1 Detailed Description

Base class for MEA data acquisition devices.

There are two different device types for MEA data acquisition devices. There are the USB-MEA devices and the MC↔\_Card. In .NET both classes can be accessed by the constructor of the base class [CMeaDeviceNet](#), which constructs the correct underlying C++ class for the USB-MEA device on the one hand or the MC\_Card device on the other hand. Through this interface both device types USB-MEA devices and MC\_Card devices can be accessed

### 11.64.2 Constructor & Destructor Documentation

#### 11.64.2.1 CMeaDeviceNet() [1/2] [CMeaDeviceNet](#) ( [McsBusTypeEnumNet](#) bustype )

Initializes a new instance of [CMeaDeviceNet](#) class.

#### Parameters

<i>bustype</i>	Type of device to use, either USB or PCI.
----------------	---

**11.64.2.2 CMeaDeviceNet()** [2/2] `CMeaDeviceNet (`  
`McsBusTypeEnumNet bustype,`  
`OnChannelData^ channelData,`  
`OnError^ error )`

Initializes a new instance of `CMeaDeviceNet` class.

#### Parameters

<i>bustype</i>	Type of device to use, either USB or PCI.
----------------	---

#### Parameters

<i>channelData</i>	Callback to call when new data is available.
--------------------	--

#### Parameters

<i>error</i>	Callback to call when an error occurred.
--------------	--

**11.64.2.3 ~CMeaDeviceNet()** `~CMeaDeviceNet ( )`

### 11.64.3 Member Function Documentation

**11.64.3.1 EnableChecksum()** `virtual uint32_t EnableChecksum (`  
`bool enable,`  
`unsigned int virtualDevice ) [virtual]`

Enable the checksum data word in the datastream. The checksum is a 32 bit counter and 2x16 bit magic numbers.

#### Parameters

<i>enable</i>	True to enable, False to disable.
<i>virtualDevice</i>	virtual device to use.

#### Returns

Error Status. 0 on success.

**11.64.3.2 EnableDigitalIn()** [1/2] virtual uint32\_t EnableDigitalIn (  
    bool *enable*,  
    unsigned int *virtualDevice* ) [virtual]

Enable the digital data word in the datastream.

#### Parameters

<i>enable</i>	True to enable, False to disable.
<i>virtualDevice</i>	virtual device to use.

#### Returns

Error Status. 0 on success.

**11.64.3.3 EnableDigitalIn()** [2/2] virtual uint32\_t EnableDigitalIn (  
    DigitalDatastreamEnableEnumNet *enable*,  
    unsigned int *virtualDevice* ) [virtual]

Enable digital data words in the datastream.

#### Parameters

<i>enable</i>	True to enable, False to disable.
<i>virtualDevice</i>	virtual device to use.

#### Returns

Error Status. 0 on success.

**11.64.3.4 EnableTimestamp()** virtual uint32\_t EnableTimestamp (  
    bool *enable*,  
    unsigned int *virtualDevice* ) [virtual]

Enable the timestamp data word in the datastream. The timestamp is a 64 bit counter.

#### Parameters

<i>enable</i>	True to enable, False to disable.
<i>virtualDevice</i>	virtual device to use.

**Returns**

Error Status. 0 on success.

**11.64.3.5 GetAnalogGain()** `virtual int32_t GetAnalogGain ( ) [virtual]`

Gets the gain of the analog inputs of the device.

**Returns**

Gain times 1000, a value of 1000 corresponds to a gain of 1.0.

**11.64.3.6 GetEnumerationSpeed()** `int32_t GetEnumerationSpeed ( )`**11.64.3.7 GetGain()** `virtual int32_t GetGain ( ) [virtual]`

Gets the amplifier gain of the device.

**Returns**

Gain times 1000, a value of 1000 corresponds to a gain of 1.0.

**11.64.3.8 SetDigitalOut()** `virtual void SetDigitalOut ( unsigned int digout_value, int pulselength ) [virtual]`

Generate a pulse on the digital output.

**Parameters**

<i>digout_value</i>	Bitmask to set on the digital out.
---------------------	------------------------------------

**Parameters**

<i>pulselength</i>	Pulselength in ms.
--------------------	--------------------

**11.64.3.9 SetNumberOfAnalogChannels()** virtual uint32\_t SetNumberOfAnalogChannels (   
 unsigned int *NumberOfChannels\_HS1*,   
 unsigned int *NumberOfChannels\_HS2*,   
 unsigned int *NumberOfChannels\_DSP*,   
 unsigned int *NumberOfChannels\_IF*,   
 unsigned int *virtualDevice* ) [virtual]

Sets the number of analog channels in the datastream for the MEA2100 device.

**Parameters**

<i>NumberOfChannels_HS1</i>	Number of analog channels from the Headstage 1.
-----------------------------	---

**Parameters**

<i>NumberOfChannels_HS2</i>	Number of analog channels from the Headstage 2.
-----------------------------	---

**Parameters**

<i>NumberOfChannels_DSP</i>	Number of data words from the DSP.
-----------------------------	------------------------------------

**Parameters**

<i>NumberOfChannels_↵_IF</i>	Number of analog channels from the Interfaceboard.
------------------------------	--

**Parameters**

<i>virtualDevice</i>	virtualDevice to use.
----------------------	-----------------------

**Returns**

Error Status. 0 on success.

**11.64.3.10 SetNumberOfChannels()** [1/2] `virtual uint32_t SetNumberOfChannels (`  
`int NumberOfChannels ) [virtual]`

Sets the number of analog channels in the datastream.

**Parameters**

<i>NumberOfChannels</i>	Number of analog channels.
-------------------------	----------------------------

**Returns**

Error Status. 0 on success.

**11.64.3.11 SetNumberOfChannels()** [2/2] `virtual uint32_t SetNumberOfChannels (`  
`int NumberOfChannels,`  
`unsigned int virtualDevice ) [virtual]`

Sets the number of analog channels in the datastream.

**Parameters**

<i>NumberOfChannels</i>	Number of analog channels.
<i>virtualDevice</i>	virtual device to use.

**Returns**

Error Status. 0 on success.

**11.64.3.12 SetTriggerMaskValue()** `virtual uint32_t SetTriggerMaskValue (`  
`unsigned int mask,`  
`unsigned int value,`  
`unsigned int virtualDevice ) [virtual]`

Defines a pattern on the digital dataword which will start a trigger when found.

**Parameters**

<i>mask</i>	Bits in the digital dataword which are monitored for a match with value.
-------------	--

**Parameters**

<i>value</i>	Pattern which must match for the trigger to start.
--------------	--

**Returns**

Error Status. 0 on success.

**11.64.3.13 SetTriggerPeriod()** `virtual uint32_t SetTriggerPeriod (`  
`int samples,`  
`unsigned int virtualDevice ) [virtual]`

Sets the maximum number of samples per trigger.

**Parameters**

<i>samples</i>	Number of samples to acquire after the trigger condition is met.
----------------	--

**Returns**

Error Status. 0 on success.

**11.64.4 Property Documentation**

**11.64.4.1 AnalogGain** `virtual int AnalogGain [get]`

The gain of the analog inputs of the device. Value is gain times 1000, a value of 1000 corresponds to a gain of 1.0.

**11.64.4.2 Gain** `virtual int Gain [get]`

The amplifier gain of the device. Value is gain times 1000, a value of 1000 corresponds to a gain of 1.0.

**11.64.4.3 MeaAudioFunctionNet** `CMeaAudioFunctionNet^ MeaAudioFunctionNet [get]`

## 11.65.2 Member Function Documentation

**11.65.2.1 GetDigitalData()** `unsigned int GetDigitalData ( )`

Get the value of the digital output.

### Returns

Value on the digital data register.

**11.65.2.2 SetDigitalData()** [1/2] `void SetDigitalData ( unsigned int bit_number, bool value )`

Generate a value on the digital output.

### Parameters

<i>bit_number</i>	Bit number to change.
-------------------	-----------------------

### Parameters

<i>value</i>	Bit value.
--------------	------------

**11.65.2.3 SetDigitalData()** [2/2] `void SetDigitalData ( unsigned int digital_value, unsigned int digital_value_mask )`

Generate a value on the digital output.

### Parameters

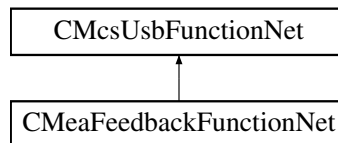

<i>digital_value</i>	Value to set.
----------------------	---------------

## Parameters

<code>digital_value_mask</code>	Mask for change.
---------------------------------	------------------

**Additional Inherited Members****11.69.1 Detailed Description**

The class to control the USB-MEA-Switch.

This class controls the settings of the USB-MEA-Switch. The box has two inputs for signals from a MEA amplifier. Each of the 64 outputs can be connected to one of the MEAs at the same channel.

**11.69.2 Constructor & Destructor Documentation****11.69.2.1 CMeaSwitchDeviceNet()** [CMeaSwitchDeviceNet](#) ( )

Constructor.

**11.69.2.2 ~CMeaSwitchDeviceNet()** [~CMeaSwitchDeviceNet](#) ( )

Destructor.

**11.69.3 Member Function Documentation****11.69.3.1 GetNumber()** unsigned short [GetNumber](#) ( )

Gets the number of boards in the device.

The MEA-Switch are delivered with 64 or 128 channels

### 11.69.3.2 GetPattern() `array<unsigned char> ^ GetPattern ( )`

Gets the pattern of the switches that are currently set in the device as char array.

### 11.69.3.3 GetPatternBool() `array<bool> ^ GetPatternBool ( )`

Gets the pattern of the switches that are currently set in the device as bools.

### 11.69.3.4 SetPattern() `void SetPattern ( array< unsigned char > ^ pattern )`

Sets the pattern of switches from a char array.

### 11.69.3.5 SetPatternBool() `void SetPatternBool ( array< bool > ^ pattern )`

Sets the pattern of switches from a.

### 11.72.1 Detailed Description

[CMultiBatteryChargerDeviceNet](#) is the class to access the MBC-08 device.

### 11.72.2 Constructor & Destructor Documentation

#### 11.72.2.1 [CMultiBatteryChargerDeviceNet\(\)](#) [CMultiBatteryChargerDeviceNet](#) ( )

Initializes a new instance of the [CMultiBatteryChargerDeviceNet](#) class.

#### 11.72.2.2 [~CMultiBatteryChargerDeviceNet\(\)](#) [virtual ~CMultiBatteryChargerDeviceNet](#) ( ) [virtual]

#### 11.72.2.3 [!CMultiBatteryChargerDeviceNet\(\)](#) [!CMultiBatteryChargerDeviceNet](#) ( )

### 11.72.3 Member Function Documentation

#### 11.72.3.1 [CapacityTest\(\)](#) [void CapacityTest](#) ( [uint32\\_t NrChannel](#) )

start capacity test on channel

#### Parameters

<a href="#">NrChannel</a>	the channel number
---------------------------	--------------------

**11.72.3.2 ChannelReset()** `void ChannelReset (`  
`uint32_t NrChannel )`

cancel charging and capacity test functions; check if battery is connected

**Parameters**

<i>NrChannel</i>	the channel number
------------------	--------------------

**11.72.3.3 GetBatteryVoltage()** `uint32_t GetBatteryVoltage (`  
`uint32_t NrChannel )`

gets the battery voltage; unit: mV

**Parameters**

<i>NrChannel</i>	the channel number
------------------	--------------------

**Returns**

the battery voltage in mV

**11.72.3.4 GetChannels()** `uint32_t GetChannels ( )`

gets number of channels

**Returns**

number of channels

**11.72.3.5 GetChannelState()** `MbcChannelStateEnumNet GetChannelState (`  
`uint32_t NrChannel )`

gets the channel state: IdleNoBattery, IdleChargeFinished, CapacityTestPreCharge, CapacityTestDischarge, StorageCharge, LowCurrentCharge, HighCurrentCharge

**Parameters**

<i>NrChannel</i>	the channel number
------------------	--------------------

**Returns**

the current state

**11.72.3.6 GetChargeCapacity()** `uint32_t GetChargeCapacity (`  
`uint32_t NrChannel )`

gets the charge capacity; unit:  $\mu\text{Ah}$

**Parameters**

<i>NrChannel</i>	the channel number
------------------	--------------------

**Returns**

the capacity in  $\mu\text{Ah}$

**11.72.3.7 GetChargeCurrent()** `uint32_t GetChargeCurrent (`  
`uint32_t NrChannel )`

gets the charge current; unit: mA

**Parameters**

<i>NrChannel</i>	the channel number
------------------	--------------------

**Returns**

the measured charge current in mA

**11.72.3.8 GetChargingMode()** `MbcChargingModeEnumNet GetChargingMode (`  
`uint32_t NrChannel )`

gets the charging mode: StorageCharge, LowCurrentCharge and HighCurrentCharge

**Parameters**

<i>NrChannel</i>	the channel number
------------------	--------------------

**Returns**

the charging mode

**11.72.3.9 GetChargingPCoefficient()** `uint32_t GetChargingPCoefficient ( )`

gets the p-coefficient for charging in mA/V / nominal charging current

**Returns**

the p-coefficient

**11.72.3.10 GetDischargeCapacity()** `uint32_t GetDischargeCapacity (   
uint32_t NrChannel )`

gets the discharge capacity; unit:  $\mu$ Ah

**Parameters**

<i>NrChannel</i>	the channel number
------------------	--------------------

**Returns**

the capacity in uAh

**11.72.3.11 GetDischargeCurrent()** `uint32_t GetDischargeCurrent (   
uint32_t NrChannel )`

gets the discharge current; unit: mA

**Parameters**

<i>NrChannel</i>	the channel number
------------------	--------------------

**Returns**

the measured discharge current in mA

**11.72.3.12 GetDischargeCurrentSetPoint()** `uint32_t GetDischargeCurrentSetPoint (   
uint32_t NrChannel )`

gets the setpoint for the discharge current; unit: mA

**Parameters**

<i>NrChannel</i>	the channel number
------------------	--------------------

**Returns**

the discharge current in mA

**11.72.3.13 GetFinalDischargeVoltage()** `uint32_t GetFinalDischargeVoltage (`  
`uint32_t NrChannel )`

gets the final discharge voltage; unit: mV

**Parameters**

<i>NrChannel</i>	the channel number
------------------	--------------------

**Returns**

the battery voltage in mV at the end of discharge

**11.72.3.14 GetRatedCapacity()** `MbcRatedCapacityEnumNet GetRatedCapacity (`  
`uint32_t NrChannel )`

gets the rated capacity

**Parameters**

<i>NrChannel</i>	the channel number
------------------	--------------------

**Returns**

the capacity

**11.72.3.15 SetChargingMode()** `void SetChargingMode (`  
`uint32_t NrChannel,`  
`MbcChargingModeEnumNet NewOperatingMode )`

sets the charging mode: StorageCharge, LowCurrentCharge and HighCurrentCharge

**Parameters**

<i>NrChannel</i>	the channel number
<i>NewOperatingMode</i>	the charging mode

**11.72.3.16 SetChargingPCoefficient()** `void SetChargingPCoefficient (`  
    `uint32_t pCoefficient )`

sets the p-coefficient for charging in mA/V / nominal charging current

Parameters

<i>pCoefficient</i>	the p-coefficient
---------------------	-------------------

**11.72.3.17 SetDischargeCurrentSetPoint()** `void SetDischargeCurrentSetPoint (`  
    `uint32_t NrChannel,`  
    `uint32_t DischargeCurrent_mA )`

sets the setpoint for the discharge current; unit: mA

Parameters

<i>NrChannel</i>	the channel number
<i>DischargeCurrent_mA</i>	the discharge current in mA

**11.72.3.18 SetFinalDischargeVoltage()** `void SetFinalDischargeVoltage (`  
    `uint32_t NrChannel,`  
    `uint32_t FinalDischargeVoltage_mV )`

sets the final discharge voltage; unit: mV

Parameters

<i>NrChannel</i>	the channel number
<i>FinalDischargeVoltage_mV</i>	the battery voltage in mV at the end of discharge

**11.72.3.19 SetRatedCapacity()** `void SetRatedCapacity (`  
    `uint32_t NrChannel,`  
    `MbcRatedCapacityEnumNet NewRatedCapacity )`

sets the rated capacity

Parameters

<i>NrChannel</i>	the channel number
<i>NewRatedCapacity</i>	the capacity

**11.72.3.20 SetRatedCapacityVolatile()** `void SetRatedCapacityVolatile (`  
`uint32_t NrChannel,`  
`MbcRatedCapacityEnumNet NewRatedCapacity )`

sets the rated capacity (i.e. charge current) without storing it persistently

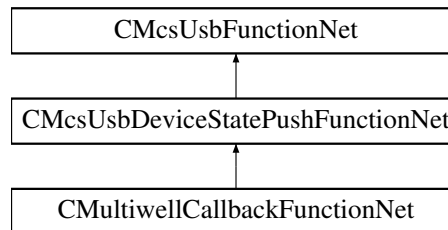

#### Parameters

<i>NrChannel</i>	the channel number
<i>NewRatedCapacity</i>	the capacity

## 11.73 CMultiwellCallbackFunctionNet Class Reference

[CMultiwellCallbackFunctionNet](#) is the class to access the Multiwell-Mini-Stimulator

## Additional Inherited Members

### 11.74.1 Detailed Description

[CMultiwellDeviceNet](#) is the class to access the Multiwell device.

### 11.74.2 Constructor & Destructor Documentation

#### 11.74.2.1 CMultiwellDeviceNet() [CMultiwellDeviceNet](#) ( )

Initializes a new instance of the [CMultiwellDeviceNet](#) class.

#### 11.74.2.2 ~CMultiwellDeviceNet() virtual ~[CMultiwellDeviceNet](#) ( ) [virtual]

#### 11.74.2.3 ~!CMultiwellDeviceNet() ~![CMultiwellDeviceNet](#) ( )

### 11.74.3 Member Function Documentation

#### 11.74.3.1 ClosePlateClamp() `void ClosePlateClamp ( )`

Closes the plate clamp.

#### 11.74.3.2 GetPlateClampLockState() `uint32_t GetPlateClampLockState ( )`

Gets the state of the plate clamp lock.

##### Returns

the state of the plate lock (unlocked/locked)

#### 11.74.3.3 GetPlateClampState() [1/2] `PlateClampEnumNet GetPlateClampState ( )`

Gets the state of the Multiwell plate clamp.

##### Returns

the state of the plate clamp (open/closed)

#### 11.74.3.4 GetPlateClampState() [2/2] `PlateClampEnumNet GetPlateClampState ( uint32_t Headstage )`

Gets the state of the plate

##### Parameters

<i>Headstage</i>	The headstage number
------------------	----------------------

##### Returns

The plate state

#### 11.74.3.5 GetPlateMux() [1/2] `uint32_t GetPlateMux ( )`

Gets the selected quarter of the electrodes on a high density Multiwell plate.

**Returns**

the selected quarter

**11.74.3.6 GetPlateMux()** [2/2] `uint32_t GetPlateMux (`  
`uint32_t Headstage )`

Gets the selected quarter of the electrodes on a high density Multiwell plate.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

the selected quarter

**11.74.3.7 GetPlateType()** [1/2] `MultiwellPlateTypeEnumNet GetPlateType ( )`

Gets the plate type.

**Returns**

the plate type

**11.74.3.8 GetPlateType()** [2/2] `MultiwellPlateTypeEnumNet GetPlateType (`  
`uint32_t Headstage )`

Gets the plate type.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

the plate type

**11.74.3.9 GetPowerMuxPlate()** `bool GetPowerMuxPlate (`  
`uint32_t Headstage )`

On the Multiwell Mini device, Query if Power to the MUX Plate is On or Off.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

"true" Power is On, "false" Power is Off

**11.74.3.10 IsPlateTypeValid() [1/2]** `bool IsPlateTypeValid ( )`

Checks whether the plate type is valid, meaning all pins have contact.

**Returns**

"true" when all pins have contact, otherwise "false".

**11.74.3.11 IsPlateTypeValid() [2/2]** `bool IsPlateTypeValid (   
uint32_t Headstage )`

Checks whether the plate type is valid, meaning all pins have contact.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

"true" when all pins have contact, otherwise "false".

**11.74.3.12 LockPlateClamp()** `void LockPlateClamp ( )`

Locks the plate clamp.

**11.74.3.13 OpenPlateClamp()** `void OpenPlateClamp ( )`

Opens the plate clamp.

**11.74.3.14 SetPlateMux() [1/2]** `void SetPlateMux (   
uint32_t Headstage,   
uint32_t muxSelection )`

Selects a one quarter of the electrodes on a high density Multiwell plate.

## Parameters

<i>Headstage</i>	The headstage to query.
<i>muxSelection</i>	the selected quarter

**11.74.3.15 SetPlateMux()** [2/2] void SetPlateMux (   
uint32\_t muxSelection )

Selects a one quarter of the electrodes on a high density Multiwell plate.

## Parameters

<i>muxSelection</i>	the selected quarter
---------------------	----------------------

**11.74.3.16 SetPlateType()** [1/2] void SetPlateType (   
MultiwellPlateTypeEnumNet plateType )

Sets the plate type.

## Parameters

<i>plateType</i>	the plate type
------------------	----------------

**11.74.3.17 SetPlateType()** [2/2] void SetPlateType (   
uint32\_t Headstage,   
MultiwellPlateTypeEnumNet plateType )

Sets the plate type.

## Parameters

<i>Headstage</i>	The headstage to query.
<i>plateType</i>	the plate type

**11.74.3.18 SetPowerMuxPlate()** void SetPowerMuxPlate (   
uint32\_t Headstage,   
bool powerOn )

On the Multiwell Mini device, turn Power to the MUX Plate On or Off.

## Parameters

<i>Headstage</i>	The headstage to query.
<i>powerOn</i>	"true" to turn Power On, "false" to turn Power Off

**11.74.3.19 StopPlateClamp()** `void StopPlateClamp ( )`

Stops the plate clamp movement.

**11.74.3.20 UnlockPlateClamp()** `void UnlockPlateClamp ( )`

Unlocks the plate clamp.

**11.75 CMultiwellOptoStimFunctionNet Class Reference**

uint16\_t *channel* )

#### Parameters

<i>channel</i>	the (analog) channel number
----------------	-----------------------------

#### Returns

absolute max. current; unit: uA

**11.75.3.2 GetColorRgb()** `uint32_t GetColorRgb (`  
`uint16_t channel )`

**Parameters**

<i>channel</i>	the (analog) channel number
----------------	-----------------------------

**Returns**

RGB-value of LED color

**11.75.3.3 GetColorStr()** `String ^ GetColorStr (`  
`uint16_t channel )`

**Parameters**

<i>channel</i>	the (analog) channel number
----------------	-----------------------------

**Returns**

LED color as string

**11.75.3.4 GetMaxDurationHighCurrentInMicroSec()** `uint32_t GetMaxDurationHighCurrentInMicroSec (`  
`uint16_t channel )`

**Parameters**

<i>channel</i>	the (analog) channel number
----------------	-----------------------------

**Returns**

max. duration the LED can stand the abs. max current; unit: us

**11.75.3.5 GetMaxDutyCycleHighCurrent()** `uint32_t GetMaxDutyCycleHighCurrent (`  
`uint16_t channel )`

**Parameters**

<i>channel</i>	the (analog) channel number
----------------	-----------------------------

**Returns**

max. duty cycle at max. current; unit: 100\*%

**11.75.3.6 GetPermanentCurrentInMicroAmp()** `uint32_t GetPermanentCurrentInMicroAmp ( uint16_t channel )`

**Parameters**

<i>channel</i>	the (analog) channel number
----------------	-----------------------------

**Returns**

max. current the LED can stand when always switched on; unit: uA

**11.75.3.7 GetWaveLengthInNanometer()** `uint32_t GetWaveLengthInNanometer ( uint16_t channel )`

**Parameters**

<i>channel</i>	the (analog) channel number
----------------	-----------------------------

**Returns**

wavelength of this channel's LEDs; unit: nm

**11.75.3.8 SetAbsMaxCurrentInMicroAmp()** `void SetAbsMaxCurrentInMicroAmp ( uint16_t channel, uint32_t AbsoluteMaxCurrent_uA )`

**Parameters**

<i>channel</i>	the (analog) channel number
<i>AbsoluteMaxCurrent_uA</i>	absolute max. current; unit: uA

**11.75.3.9 SetColorRgb()** `void SetColorRgb ( uint16_t channel, uint32_t ColorRGB )`

## Parameters

<i>channel</i>	the (analog) channel number
<i>ColorRGB</i>	RGB-value of LED color

**11.75.3.10 SetColorStr()** `void SetColorStr (`  
     `uint16_t channel,`  
     `String^ ColorString )`

## Parameters

<i>channel</i>	the (analog) channel number
<i>ColorString</i>	LED color as string

**11.75.3.11 SetMaxDurationHighCurrentInMicroSec()** `void SetMaxDurationHighCurrentInMicroSec (`  
     `uint16_t channel,`  
     `uint32_t AbsoluteMaxDuration_us )`

## Parameters

<i>channel</i>	the (analog) channel number
<i>AbsoluteMaxDuration_us</i>	max. duration the LED can stand the abs. max current; unit: us

**11.75.3.12 SetMaxDutyCycleHighCurrent()** `void SetMaxDutyCycleHighCurrent (`  
     `uint16_t channel,`  
     `uint32_t MaxDutyCycleHighCurrent )`

## Parameters

<i>channel</i>	the (analog) channel number
<i>MaxDutyCycleHighCurrent</i>	max. duty cycle at max. current; unit: 100*%

**11.75.3.13 SetPermanentCurrentInMicroAmp()** `void SetPermanentCurrentInMicroAmp (`  
     `uint16_t channel,`  
     `uint32_t PermanentCurrent_uA )`

## Parameters

<i>channel</i>	the (analog) channel number
<i>PermanentCurrent_uA</i>	max. current the LED can stand when always switched on; unit: uA

**11.75.3.14 SetWaveLengthInNanometer()** `void SetWaveLengthInNanometer (`  
     `uint16_t channel,`  
     `uint32_t WaveLength_nm )`

#### Parameters

<i>channel</i>	the (analog) channel number
<i>WaveLength_nm</i>	wavelength of this channel's LEDs; unit: nm

## 11.76 CNF\_GenDeviceNet Class Reference

## Additional Inherited Members

### 11.84.1 Detailed Description

[CPositionIIDeviceNet](#) is the class to control PositionII devices

### 11.84.2 Constructor & Destructor Documentation

#### 11.84.2.1 [CPositionIIDeviceNet](#)() [CPositionIIDeviceNet](#) ( )

Initializes a new instance of the [CPositionIIDeviceNet](#) class.

#### 11.84.2.2 [~CPositionIIDeviceNet](#)() [virtual ~CPositionIIDeviceNet](#) ( ) [virtual]

#### 11.84.2.3 ["!CPositionIIDeviceNet](#)() [!CPositionIIDeviceNet](#) ( )

### 11.84.3 Member Function Documentation

#### 11.84.3.1 [GetCoilCommunication](#)() [uint32\\_t GetCoilCommunication](#) ( [uint16\\_t coil](#) )

get if the communication to the coil is working

#### Parameters

<i>coil</i>	the coil
-------------	----------

#### Returns

is communicating

**11.84.3.2 GetDebugData()** `void GetDebugData (`  
`uint16_t coil,`  
`[System::Runtime::InteropServices::Out] uint16_t% index,`  
`[System::Runtime::InteropServices::Out] uint16_t% voltage,`  
`[System::Runtime::InteropServices::Out] uint16_t% numberofpulses,`  
`[System::Runtime::InteropServices::Out] uint16_t% mediantime )`

get the oldest debug entry for a certain coil

#### Parameters

<i>coil</i>	the coil
<i>index</i>	the debug entry index number
<i>voltage</i>	the voltage applied
<i>numberofpulses</i>	the number of pulses detected
<i>mediantime</i>	the median time between pulses

**11.84.3.3 GetEventData()** `void GetEventData (`  
`[System::Runtime::InteropServices::Out] uint16_t% index,`  
`[System::Runtime::InteropServices::Out] uint8_t% year,`  
`[System::Runtime::InteropServices::Out] uint8_t% month,`  
`[System::Runtime::InteropServices::Out] uint8_t% day,`  
`[System::Runtime::InteropServices::Out] uint8_t% hour,`  
`[System::Runtime::InteropServices::Out] uint8_t% minute,`  
`[System::Runtime::InteropServices::Out] uint8_t% second,`  
`[System::Runtime::InteropServices::Out] uint16_t% coil,`  
`[System::Runtime::InteropServices::Out] uint16_t% type,`  
`[System::Runtime::InteropServices::Out] uint16_t% value )`

get the oldest event entry

#### Parameters

<i>index</i>	the event index number
<i>year</i>	the year
<i>month</i>	the month
<i>day</i>	the day
<i>hour</i>	the hour
<i>minute</i>	the minute
<i>second</i>	the second
<i>coil</i>	the coil
<i>type</i>	the event type
<i>value</i>	the even value

**11.84.3.4 GetImplantCurrentSetpoint()** `uint32_t GetImplantCurrentSetpoint (`  
`uint16_t coil )`

sets the implant current setpoint

**Parameters**

<i>coil</i>	the coil
-------------	----------

**Returns**

the current

**11.84.3.5 GetImplantResult()** `uint32_t GetImplantResult (`  
`uint16_t coil )`

gets the last result of the implant pulse trigger

**Parameters**

<i>coil</i>	the coil
-------------	----------

**Returns**

the result

**11.84.3.6 GetImplantState()** `uint32_t GetImplantState (`  
`uint16_t coil )`

gets the implantat state

**Parameters**

<i>coil</i>	the coil
-------------	----------

**Returns**

the state

**11.84.3.7 GetOnOff()** `uint32_t GetOnOff (`  
`uint16_t coil )`

get if the coil is switched on/off

**Parameters**

<i>coil</i>	the coil
-------------	----------

**Returns**

0 = off, 1 = on

**11.84.3.8 GetPowerStrength()** `uint32_t GetPowerStrength (`  
     `uint16_t coil )`

sets the power for the trigger pulses

**Parameters**

<i>coil</i>	the coil
-------------	----------

**Returns**

the power

**11.84.3.9 GetRTC()** `void GetRTC (`  
     `[System::Runtime::InteropServices::Out] uint8_t% year,`  
     `[System::Runtime::InteropServices::Out] uint8_t% month,`  
     `[System::Runtime::InteropServices::Out] uint8_t% day,`  
     `[System::Runtime::InteropServices::Out] uint8_t% hour,`  
     `[System::Runtime::InteropServices::Out] uint8_t% minute,`  
     `[System::Runtime::InteropServices::Out] uint8_t% second )`

Get the RTC

**Parameters**

<i>year</i>	the year
<i>month</i>	the month
<i>day</i>	the day
<i>hour</i>	the hour
<i>minute</i>	the minute
<i>second</i>	the second

**11.84.3.10 GetStateDebugData()** `uint32_t GetStateDebugData (`  
     `uint16_t coil )`

get the debug queue state

**Parameters**

<i>coil</i>	the coil
-------------	----------

**Returns**

the state

**11.84.3.11 GetStateEventData()** `uint32_t GetStateEventData ( )`

get the event queue state

**Returns**

the state

**11.84.3.12 SetImplantCurrentSetpoint()** `void SetImplantCurrentSetpoint (`  
`uint16_t coil,`  
`uint32_t current )`

gets the implant current setpoint

**Parameters**

<i>coil</i>	the coil
<i>current</i>	the current

**11.84.3.13 SetPowerStrength()** `void SetPowerStrength (`  
`uint16_t coil,`  
`uint32_t power )`

gets the power for the trigger pulses

**Parameters**

<i>coil</i>	the coil
<i>power</i>	the power

**11.84.3.14 SetRTC()** `void SetRTC (`  
`uint8_t year,`  
`uint8_t month,`  
`uint8_t day,`  
`uint8_t hour,`  
`uint8_t minute,`  
`uint8_t second )`

Set the RTC

**Parameters**

<i>year</i>	the year
<i>month</i>	the month
<i>day</i>	the day
<i>hour</i>	the hour
<i>minute</i>	the minute
<i>second</i>	the second

**11.84.3.15 SetStateDebugData()** `void SetStateDebugData (`  
    `uint16_t coil,`  
    `uint32_t state )`

clears/starts/stops the debug queue for a certain coil

**Parameters**

<i>coil</i>	the coil
<i>state</i>	clear/start/stop

**11.84.3.16 SetStateEventData()** `void SetStateEventData (`  
    `uint32_t state )`

clears/starts/stops the event queue for a certain coil

**Parameters**

<i>state</i>	clear/start/stop
--------------	------------------

**11.84.3.17 SwitchOnOff()** `void SwitchOnOff (`  
    `uint16_t coil,`  
    `uint32_t on )`

switched the coil on of

**Parameters**

<i>coil</i>	the coil
<i>on</i>	0 = off, 1 = on

### 11.84.4 Property Documentation

#### 11.84.4.1 RFFunction `CRFFFunctionNet^ RFFunction [get]`

## 11.85 CPositionImpDeviceNet Class Reference

`CPositionImpDeviceNet` is the class to access the Position/Imp devices

Inheritance diagram for `CPositionImpDeviceNet`:

### Public Member Functions

- `CPositionImpDeviceNet ()`  
*Initializes a new instance of the `CPositionImpDeviceNet` class.*
- virtual `~CPositionImpDeviceNet ()`
- `!CPositionImpDeviceNet ()`
- void `ConnectImp (uint32_t id)`  
*Connect to a Imp device with a certain ID*
- uint32\_t `ConnectedImp ()`  
*The ID of the connected Imp device*
- int32\_t `GetRFFrequency ()`  
*Gets currently used RF frequency*
- void `SetRFFrequency (int32_t frequency)`  
*Sets the current RF frequency*
- uint32\_t `GetDeviceList (int32_t index)`  
*Gets the device list*
- void `SetDeviceList (int32_t index, uint32_t id)`  
*Sets the device list*
- uint32\_t `GetImpId ()`  
*Gets the ID of the impedance measure device*
- void `SetImpId (uint32_t id)`  
*Sets the ID of the impedance measure device*

### Additional Inherited Members

#### 11.85.1 Detailed Description

`CPositionImpDeviceNet` is the class to access the Position/Imp devices

## 11.85.2 Constructor & Destructor Documentation

### 11.85.2.1 CPositionImpDeviceNet() `CPositionImpDeviceNet ( )`

Initializes a new instance of the `CPositionImpDeviceNet` class.

### 11.85.2.2 ~CPositionImpDeviceNet() `virtual ~CPositionImpDeviceNet ( ) [virtual]`

### 11.85.2.3 "!CPositionImpDeviceNet() `!CPositionImpDeviceNet ( )`

## 11.85.3 Member Function Documentation

### 11.85.3.1 ConnectedImp() `uint32_t ConnectedImp ( )`

The ID of the connected Imp device

#### Returns

The ID

### 11.85.3.2 ConnectImp() `void ConnectImp ( uint32_t id )`

Connect to a Imp device with a certain ID

#### Parameters

<i>id</i>	The ID
-----------	--------

### 11.85.3.3 GetDeviceList() `uint32_t GetDeviceList ( int32_t index )`

Gets the device list

## Parameters

<i>index</i>	the index
--------------	-----------

## Returns

the ID

**11.85.3.4 GetImpId()** `uint32_t GetImpId ( )`

Gets the ID of the impedance measure device

## Returns

the ID

**11.85.3.5 GetRFFrequency()** `int32_t GetRFFrequency ( )`

Gets currently used RF frequency

## Returns

The frequency

**11.85.3.6 SetDeviceList()** `void SetDeviceList (   
int32_t index,   
uint32_t id )`

Sets the device list

## Parameters

<i>index</i>	the index
<i>id</i>	the ID

**11.85.3.7 SetImpId()** `void SetImpId (   
uint32_t id )`

Sets the ID of the impedance measure device

**Parameters**

<i>id</i>	the ID
-----------	--------

**11.85.3.8 SetRFFrequency()** `void SetRFFrequency (`  
                                  `int32_t frequency )`

Sets the current RF frequency

**Parameters**

<i>frequency</i>	The frequency
------------------	---------------

*Fire a pressure pulse from the reservoir*
- int32\_t [MeasureReservoir](#) ()  
*Measures the reservoir pressure*

## Additional Inherited Members

### 11.87.1 Detailed Description

[CPPCFunctionNet](#) is the class to access the PPC (high precision Patch Peristaltic patch Pump

### 11.87.2 Constructor & Destructor Documentation

**11.87.2.1 CPPCFunctionNet()** [1/2] [CPPCFunctionNet](#) (  
[CMcsUsbNet](#)^ mcsusb,  
[CMcsUsbFunctionPointerContainer](#)^ pPPCFunctionPointerContainer )

Initializes a new instance of the [CPPCFunctionNet](#) class.

**11.87.2.2 CPPCFunctionNet()** [2/2] `CPPCFunctionNet (`  
`CMcsUsbNet^ mcsusb )`

**11.87.2.3 ~CPPCFunctionNet()** `virtual ~CPPCFunctionNet ( ) [virtual]`

**11.87.2.4 "!CPPCFunctionNet()** `!CPPCFunctionNet ( )`

### 11.87.3 Member Function Documentation

**11.87.3.1 FirePressurePulse()** `void FirePressurePulse (`  
`int32_t duration,`  
`int32_t nextpressure )`

Fire a pressure pulse from the reservoir

#### Parameters

<i>duration</i>	The pulse duration (valves open)
<i>nextpressure</i>	The next pressure

**11.87.3.2 GetAnalogVoltage()** `uint16_t GetAnalogVoltage (`  
`uint16_t channel )`

Reads the current analog voltage

#### Parameters

<i>channel</i>	The Channel Number
----------------	--------------------

#### Returns

The Analog Voltage

**11.87.3.3 GetAnalogVoltageRange()** `void GetAnalogVoltageRange (`  
`uint16_t channel,`

```
[System::Runtime::InteropServices::Out] uint16_t% min_voltage,  
[System::Runtime::InteropServices::Out] uint16_t% max_voltage )
```

Reads the Analog Input Voltage Range

## Parameters

<i>channel</i>	The Channel Number
<i>min_voltage</i>	The voltage that should be seen as the minimum voltage
<i>max_voltage</i>	The voltage that should be seen as the maximum voltage

**11.87.3.4 GetDigitalIn()** `uint16_t GetDigitalIn (`  
`uint16_t channel )`

Reads the digital input state

## Parameters

<i>channel</i>	The Channel Number
----------------	--------------------

## Returns

The Digital State

**11.87.3.5 GetPressureRange()** `void GetPressureRange (`  
`uint16_t channel,`  
`[System::Runtime::InteropServices::Out] int32_t% lower_pressure,`  
`[System::Runtime::InteropServices::Out] int32_t% upper_pressure )`

Get the pressure range that is used between the analog voltage or the digital states

## Parameters

<i>channel</i>	The Channel Number
<i>lower_pressure</i>	The lower border of the pressure range
<i>upper_pressure</i>	The upper border of the pressure range

**11.87.3.6 GetPumpModeType()** `PP_Pump_Mode_Type_EnumNet GetPumpModeType (`  
`uint16_t channel )`

Reads the Pump Mode Type.

## Parameters

<i>channel</i>	The Channel Number
----------------	--------------------

**Returns**

The Pump Mode Type.

**11.87.3.7 GetPumpSpeedUnit()** `int GetPumpSpeedUnit (`  
`uint16_t channel )`

Reads the Pump Speed Unit

**Parameters**

<i>channel</i>	The Channel Number
----------------	--------------------

**Returns**

The Speed Unit

**11.87.3.8 GetSupplyVoltage()** `uint16_t GetSupplyVoltage ( )`

Reads the current supply voltage in mV

**Returns**

The supply voltage

**11.87.3.9 GetValveActive()** `int GetValveActive (`  
`uint16_t valve )`

Gets the valve active/inactive state

**Parameters**

<i>valve</i>	The valve number
--------------	------------------

**Returns**

The valve state

**11.87.3.10 IsBusy()** `void IsBusy (`  
`[System::Runtime::InteropServices::Out] int16_t% task,`  
`[System::Runtime::InteropServices::Out] int16_t% wait )`

Is the PPC busy with a task

**Parameters**

<i>task</i>	The task state
<i>wait</i>	The wait state

**11.87.3.11 LoadPressure()** `void LoadPressure (`  
    `int32_t pressure,`  
    `uint32_t options )`

Loads the reservoir with a pressure

**Parameters**

<i>pressure</i>	The pressure
<i>options</i>	The options: end with 0=regulate on patch 1=regulate on reservoir

**11.87.3.12 MeasureReservoir()** `int32_t MeasureReservoir ( )`

Measures the reservoir pressure

**Returns**

The pressure

**11.87.3.13 SetAnalogVoltageRange()** `void SetAnalogVoltageRange (`  
    `uint16_t channel,`  
    `uint16_t min_voltage,`  
    `uint16_t max_voltage )`

Writes the Analog Input Voltage Range

**Parameters**

<i>channel</i>	The Channel Number
<i>min_voltage</i>	The voltage that should be seen as the minimum voltage
<i>max_voltage</i>	The voltage that should be seen as the maximum voltage

**11.87.3.14 SetPressureOffset()** `void SetPressureOffset ( )`

Sets the pressure offset

**11.87.3.15 SetPressureRange()** `void SetPressureRange (`  
    `uint16_t channel,`  
    `int32_t lower_pressure,`  
    `int32_t upper_pressure )`

Get the pressure range that is used between the analog voltage or the digital states

Parameters

<i>channel</i>	The Channel Number
<i>lower_pressure</i>	The lower border of the pressure range
<i>upper_pressure</i>	The upper border of the pressure range

**11.87.3.16 SetPumpModeType()** `void SetPumpModeType (`  
    `uint16_t channel,`  
    `PP_Pump_Mode_Type_EnumNet PumpMode )`

Writes the config string from the device.

Parameters

<i>channel</i>	The Channel Number
<i>PumpMode</i>	The Pump Mode Type.

**11.87.3.17 SetPumpSpeedUnit()** `void SetPumpSpeedUnit (`  
    `uint16_t channel,`  
    `int SpeedUnit )`

Writes the Pump Speed Unit

Parameters

<i>channel</i>	The Channel Number
<i>SpeedUnit</i>	The Speed Unit

**11.87.3.18 SetValveActive()** `void SetValveActive (`  
    `uint16_t valve,`  
    `int valveActive )`

Sets the valve active/inactive state

Parameters

<i>valve</i>	The valve number
<i>valveActive</i>	The valve state

*Writes the generator period*
- int32\_t [GetPulseLength](#) (int32\_t generator\_number)  
*Reads the generator pulse length*
- void [SetPulseLength](#) (int32\_t generator\_number, int32\_t pulselength\_in\_10us)  
*Writes the generator pulse length*
- void [GetModeSelect](#) (int32\_t generator\_number, [System::Runtime::InteropServices::Out][PulseGenerator\\_Mode\\_EnumNet](#)% mode, [System::Runtime::InteropServices::Out]int32\_t% digitalchannel)  
*Reads the generator mode*
- void [SetModeSelect](#) (int32\_t generator\_number, [PulseGenerator\\_Mode\\_EnumNet](#) mode, int32\_t digitalchannel)  
*Writes the generator mode*

## Additional Inherited Members

### 11.92.1 Detailed Description

[CPulseGeneratorFunctionNet](#) is the class to control the pulse generator for video tracking

### 11.92.2 Constructor & Destructor Documentation

**11.92.2.1 [CPulseGeneratorFunctionNet](#)() [1/2]** [CPulseGeneratorFunctionNet](#) (  
    [CMcsUsbNet](#)<sup>^</sup> mcsusb,  
    [CMcsUsbFunctionPointerContainer](#)<sup>^</sup> pPulseGeneratorFunctionPointerContainer )

Initializes a new instance of the [CPulseGeneratorFunctionNet](#) class.

**11.92.2.2 [CPulseGeneratorFunctionNet](#)() [2/2]** [CPulseGeneratorFunctionNet](#) (  
    [CMcsUsbNet](#)<sup>^</sup> mcsusb )

**11.92.2.3 [~CPulseGeneratorFunctionNet](#)()** virtual [~CPulseGeneratorFunctionNet](#) ( ) [virtual]

#### 11.92.2.4 "!CPulseGeneratorFunctionNet() !CPulseGeneratorFunctionNet ( )

### 11.92.3 Member Function Documentation

**11.92.3.1 GetModeSelect()** void GetModeSelect (   
 int32\_t *generator\_number*,   
 [System::Runtime::InteropServices::Out] [PulseGenerator\\_Mode\\_EnumNet](#)% *mode*,   
 [System::Runtime::InteropServices::Out] int32\_t% *digitalchannel* )

Reads the generator mode

#### Parameters

<i>generator_number</i>	The generator number
<i>mode</i>	The generator mode
<i>digitalchannel</i>	The digital in channel used as gate

**11.92.3.2 GetPeriod()** int32\_t GetPeriod (   
 int32\_t *generator\_number* )

Reads the generator period

#### Parameters

<i>generator_number</i>	The generator number
-------------------------	----------------------

#### Returns

The period

**11.92.3.3 GetPulseLength()** int32\_t GetPulseLength (   
 int32\_t *generator\_number* )

Reads the generator pulse length

#### Parameters

<i>generator_number</i>	The generator number
-------------------------	----------------------

**Returns**

The pulse length

**11.92.3.4 SetModeSelect()** `void SetModeSelect (`  
    `int32_t generator_number,`  
    `PulseGenerator_Mode_EnumNet mode,`  
    `int32_t digitalchannel )`

Writes the generator mode

**Parameters**

<i>generator_number</i>	The generator number
<i>mode</i>	The generator mode
<i>digitalchannel</i>	The digital in channel used as gate

**11.92.3.5 SetPeriod()** `void SetPeriod (`  
    `int32_t generator_number,`  
    `int32_t period_in_samples )`

Writes the generator period

**Parameters**

<i>generator_number</i>	The generator number
<i>period_in_samples</i>	The period

**11.92.3.6 SetPulseLength()** `void SetPulseLength (`  
    `int32_t generator_number,`  
    `int32_t pulselength_in_10us )`

Writes the generator pulse length

**Parameters**

<i>generator_number</i>	The generator number
<i>pulselength_in_10us</i>	The pulse length

### 11.96.1 Detailed Description

[CRFFunctionNet](#) is the class to control RF devices

### 11.96.2 Constructor & Destructor Documentation

**11.96.2.1 [CRFFunctionNet\(\)](#) [1/2]** [CRFFunctionNet](#) (  
     [CMcsUsbNet](#)^ *mcsusb*,  
     [CMcsUsbFunctionPointerContainer](#)^ *pRFFunctionPointerContainer* )

Initializes a new instance of the [CRFFunctionNet](#) class.

**11.96.2.2 [CRFFunctionNet\(\)](#) [2/2]** [CRFFunctionNet](#) (  
     [CMcsUsbNet](#)^ *mcsusb* )

**11.96.2.3 [~CRFFunctionNet\(\)](#)** virtual [~CRFFunctionNet](#) ( ) [virtual]

**11.96.2.4 ["!CRFFunctionNet\(\)](#)** [!CRFFunctionNet](#) ( )

### 11.96.3 Member Function Documentation

**11.96.3.1 [Connect\(\)](#)** void [Connect](#) (  
     uint32\_t *sn* )

connect to a RF device, use 0 to disconnect

**Parameters**

<i>sn</i>	the serial number
-----------	-------------------

**11.96.3.2 GetAvailableDeviceList()** `array<uint32_t> ^ GetAvailableDeviceList ( )`

get a list of available devices

**Returns**

array of devices

**11.96.3.3 GetAvailableDeviceListEx()** `array<uint32_t> ^ GetAvailableDeviceListEx (   
int list_Length )`

get a list of available devices

**Parameters**

<i>list_Length</i>	The maximal length of list.
--------------------	-----------------------------

**Returns**

array of devices

**11.96.3.4 GetAvailableStateList()** `array<uint32_t> ^ GetAvailableStateList ( )`

get a list of the states of the available devices

**Returns**

array of states

**11.96.3.5 GetAvailableStateListEx()** `array<uint32_t> ^ GetAvailableStateListEx (   
int list_Length )`

get a list of the states of the available devices

**Parameters**

<i>list_Length</i>	The maximal length of list.
--------------------	-----------------------------

**Returns**

array of states

**11.96.3.6 GetBaseFrequency()** `uint32_t GetBaseFrequency (`  
`CFirmwareDestinationNet destination )`

gets the base advertise frequency

**Parameters**

<i>destination</i>	the destination to query
--------------------	--------------------------

**Returns**

the frequency

**11.96.3.7 GetConnectedDevice()** `uint32_t GetConnectedDevice ( )`

get connect RF device, 0 = no device connected

**Returns**

the serial number

**11.96.3.8 GetState()** `uint32_t GetState ( )`

get connection state

**Returns**

the state

**11.96.3.9 GetTestMode()** `uint32_t GetTestMode ( )`

gets test mode

**Returns**

the mode

**11.96.3.10 GetWorkingFrequency()** `uint32_t GetWorkingFrequency ( )`

gets the working frequency

**Returns**

the frequency

**11.96.3.11 SetBaseFrequency()** `void SetBaseFrequency (   
    CFirmwareDestinationNet destination,   
    uint32_t frequency )`

sets the base advertise frequency

**Parameters**

<i>destination</i>	the destination to set
<i>frequency</i>	the frequency

**11.96.3.12 SetTestMode()** `void SetTestMode (   
    uint32_t mode )`

set test mode

**Parameters**

<i>mode</i>	the mode
-------------	----------

**11.96.3.13 SetWorkingFrequency()** `void SetWorkingFrequency (   
    uint32_t frequency )`

sets the working frequency

## Parameters

<i>frequency</i>	the frequency
------------------	---------------

### 11.100.1 Detailed Description

[CRoboDeviceNet](#) is the base class for all Robo platform based devices

### 11.100.2 Constructor & Destructor Documentation

**11.100.2.1 CRoboDeviceNet()** [CRoboDeviceNet](#) (  
void )

**11.100.2.2 ~CRoboDeviceNet()** [~CRoboDeviceNet](#) (  
void )

### 11.100.3 Member Function Documentation

**11.100.3.1 CancelPoolLoop()** void CancelPoolLoop ( )

**11.100.3.2 CancelPoolLoopAndStopMovement()** `void CancelPoolLoopAndStopMovement ( )`

**11.100.3.3 EnableQueue()** `void EnableQueue (`  
`bool enable )`

**11.100.3.4 FindReference()** [1/2] `void FindReference (`  
`unsigned char busaddress,`  
`char axes )`

**11.100.3.5 FindReference()** [2/2] `void FindReference (`  
`unsigned char busaddress,`  
`char axes,`  
`int timeout )`

Searches the reference position of the motor

**Parameters**

<i>busaddress</i>	Address of the McsBus
<i>axes</i>	Bit pattern of axes to drive
<i>timeout</i>	Timeout of maximal waiting for the end of the command (-1 is forever)

**11.100.3.6 GetAirpressure()** `unsigned int GetAirpressure ( )`

**11.100.3.7 GetAirpressureLimit()** `void GetAirpressureLimit (`  
`[System::Runtime::InteropServices::Out] unsigned int% lowerpressure,`  
`[System::Runtime::InteropServices::Out] unsigned int% upperpressure )`

**11.100.3.8 GetAirValve()** `unsigned int GetAirValve ( )`

**11.100.3.9 GetCurrentAirvalve()** `unsigned int GetCurrentAirvalve ( )`

**11.100.3.10 GetCurrentAirvalveLimit()** void GetCurrentAirvalveLimit (   
[System::Runtime::InteropServices::Out] unsigned int% *lowercurrent*,   
[System::Runtime::InteropServices::Out] unsigned int% *uppercurrent* )

**11.100.3.11 GetCurrentPosition()** void GetCurrentPosition (   
unsigned char *busaddress*,   
char *axes*,   
[System::Runtime::InteropServices::Out] int% *x*,   
[System::Runtime::InteropServices::Out] int% *y* )

Gets the current position of motors

#### Parameters

<i>busaddress</i>	Address of the McsBus
<i>axes</i>	Bit pattern of axes to drive
<i>x</i>	Current position of first axis if pattern in axes is set
<i>y</i>	Current position of second axis if pattern in axes is set

**11.100.3.12 GetErrorAirpressure()** unsigned int GetErrorAirpressure ( )

**11.100.3.13 GetErrorCurrentAirvalve()** unsigned int GetErrorCurrentAirvalve ( )

**11.100.3.14 GetErrorVoltage12V()** unsigned int GetErrorVoltage12V ( )

**11.100.3.15 GetErrorVoltage5V()** unsigned int GetErrorVoltage5V ( )

**11.100.3.16 GetErrorVoltageAirvalve()** unsigned int GetErrorVoltageAirvalve ( )

**11.100.3.17 GetErrorVoltageRs485A()** unsigned int GetErrorVoltageRs485A ( )

**11.100.3.18 GetErrorVoltageRs485B()** unsigned int GetErrorVoltageRs485B ( )

**11.100.3.19 GetErrorVoltageValves()** unsigned int GetErrorVoltageValves ( )

**11.100.3.20 GetInMovement()** bool GetInMovement ( )

Low level command, gets the internal state "In Movement"

**11.100.3.21 GetMinPressure()** int GetMinPressure ( )

**11.100.3.22 GetMovementError()** uint32\_t GetMovementError ( )

Low level command, gets the error of the last movement end

**11.100.3.23 GetVoltage12V()** unsigned int GetVoltage12V ( )

**11.100.3.24 GetVoltage12VLimit()** void GetVoltage12VLimit (   
 [System::Runtime::InteropServices::Out] unsigned int% *lowervoltage*,   
 [System::Runtime::InteropServices::Out] unsigned int% *uppervoltage* )

**11.100.3.25 GetVoltage5V()** unsigned int GetVoltage5V ( )

**11.100.3.26 GetVoltage5VLimit()** void GetVoltage5VLimit (   
 [System::Runtime::InteropServices::Out] unsigned int% *lowervoltage*,   
 [System::Runtime::InteropServices::Out] unsigned int% *uppervoltage* )

**11.100.3.27 GetVoltageAirvalve()** unsigned int GetVoltageAirvalve ( )

**11.100.3.28 GetVoltageAirvalveLimit()** void GetVoltageAirvalveLimit (   
 [System::Runtime::InteropServices::Out] unsigned int% *lowervoltage*,   
 [System::Runtime::InteropServices::Out] unsigned int% *uppervoltage* )

**11.100.3.29 GetVoltageRs485A()** unsigned int GetVoltageRs485A ( )

**11.100.3.30 GetVoltageRs485ALimit()** void GetVoltageRs485ALimit (   
 [System::Runtime::InteropServices::Out] unsigned int% *lowervoltage*,   
 [System::Runtime::InteropServices::Out] unsigned int% *uppervoltage* )

**11.100.3.31 GetVoltageRs485B()** unsigned int GetVoltageRs485B ( )

**11.100.3.32 GetVoltageRs485BLimit()** void GetVoltageRs485BLimit (   
 [System::Runtime::InteropServices::Out] unsigned int% *lowervoltage*,   
 [System::Runtime::InteropServices::Out] unsigned int% *uppervoltage* )

**11.100.3.33 GetVoltageValves()** unsigned int GetVoltageValves ( )

**11.100.3.34 GetVoltageValvesLimit()** void GetVoltageValvesLimit (   
 [System::Runtime::InteropServices::Out] unsigned int% *lowervoltage*,   
 [System::Runtime::InteropServices::Out] unsigned int% *uppervoltage* )

**11.100.3.35 IsQueueEnabled()** bool IsQueueEnabled ( )

**11.100.3.36 IsQueueStarted()** bool IsQueueStarted ( )

**11.100.3.37 MoveAbs()** [1/4] void MoveAbs (   
 unsigned char *busaddress*,   
 char *axes*,   
 array< int >^ *pos* )

Moves the motor to the new absolute position

**Parameters**

<i>busaddress</i>	Address of the McsBus
<i>axes</i>	Bit pattern of axes to drive
<i>pos</i>	Positions of the axis 0 to 3, if pattern in axes is set

**11.100.3.38 MoveAbs() [2/4]** `void MoveAbs (`  
    `unsigned char busaddress,`  
    `char axes,`  
    `array< int >^ pos,`  
    `int timeout )`

Moves the motor to the new absolute position

**Parameters**

<i>busaddress</i>	Address of the McsBus
<i>axes</i>	Bit pattern of axes to drive
<i>pos</i>	Positions of the axis 0 to 3, if pattern in axes is set
<i>timeout</i>	Timeout of maximal waiting for the end of the command (-1 is forever)

**11.100.3.39 MoveAbs() [3/4]** `void MoveAbs (`  
    `unsigned char busaddress,`  
    `char axes,`  
    `int x,`  
    `int y )`

Moves the motor to the new absolute position

**Parameters**

<i>busaddress</i>	Address of the McsBus
<i>axes</i>	Bit pattern of axes to drive
<i>x</i>	Position of first axis, if pattern in axes is set
<i>y</i>	Position of second axis if pattern in axes is set

**11.100.3.40 MoveAbs() [4/4]** `void MoveAbs (`  
    `unsigned char busaddress,`  
    `char axes,`  
    `int x,`  
    `int y,`  
    `int timeout )`

Moves the motor to the new absolute position

## Parameters

<i>busaddress</i>	Address of the McsBus
<i>axes</i>	Bit pattern of axes to drive
<i>x</i>	Position of first axis, if pattern in axes is set
<i>y</i>	Position of second axis if pattern in axes is set
<i>timeout</i>	Timeout of maximal waiting for the end of the command (-1 is forever)

**11.100.3.41 NullCommand()** `void NullCommand (`  
     unsigned int *marker* )

**11.100.3.42 SetAirpressureLimit()** `void SetAirpressureLimit (`  
     unsigned int *lowerpressure*,  
     unsigned int *upperpressure* )

**11.100.3.43 SetAirValve()** `void SetAirValve (`  
     unsigned int *onoff* )

**11.100.3.44 SetCurrentAirvalveLimit()** `void SetCurrentAirvalveLimit (`  
     unsigned int *lowercurrent*,  
     unsigned int *uppercurrent* )

**11.100.3.45 SetCurrentAndAir() [1/2]** `void SetCurrentAndAir (`  
     unsigned char *busaddress*,  
     char *axes*,  
     unsigned short *onoff* )

**11.100.3.46 SetCurrentAndAir() [2/2]** `void SetCurrentAndAir (`  
     unsigned char *busaddress*,  
     char *axes*,  
     unsigned short *onoff*,  
     int *timeout* )

**11.100.3.47 SetInMovement()** `void SetInMovement ( )`

Low level command, sets the internal state to "In Movement"

**11.100.3.48 SetMinPressure()** `void SetMinPressure (`  
`int pressure )`

**11.100.3.49 SetVoltage12VLimit()** `void SetVoltage12VLimit (`  
`unsigned int lowervoltage,`  
`unsigned int uppervoltage )`

**11.100.3.50 SetVoltage5VLimit()** `void SetVoltage5VLimit (`  
`unsigned int lowervoltage,`  
`unsigned int uppervoltage )`

**11.100.3.51 SetVoltageAirvalveLimit()** `void SetVoltageAirvalveLimit (`  
`unsigned int lowervoltage,`  
`unsigned int uppervoltage )`

**11.100.3.52 SetVoltageRs485ALimit()** `void SetVoltageRs485ALimit (`  
`unsigned int lowervoltage,`  
`unsigned int uppervoltage )`

**11.100.3.53 SetVoltageRs485BLimit()** `void SetVoltageRs485BLimit (`  
`unsigned int lowervoltage,`  
`unsigned int uppervoltage )`

**11.100.3.54 SetVoltageValvesLimit()** `void SetVoltageValvesLimit (`  
`unsigned int lowervoltage,`  
`unsigned int uppervoltage )`

**11.100.3.55 StartQueue()** `void StartQueue (`  
    `bool start )`

**11.100.3.56 StopMovement() [1/2]** `void StopMovement (`  
    `unsigned char busaddress,`  
    `char axes )`

**11.100.3.57 StopMovement() [2/2]** `void StopMovement (`  
    `unsigned char busaddress,`  
    `char axes,`  
    `int timeout )`

Stops the current movement

#### Parameters

<i>busaddress</i>	Address of the McsBus
<i>axes</i>	Bit pattern of axes to drive
<i>timeout</i>	Timeout of maximal waiting for the end of the command (-1 is forever)

**11.100.3.58 WaitTimer()** `void WaitTimer (`  
    `uint32_t waittime,`  
    `int timeout )`

## 11.100.4 Member Data Documentation

**11.100.4.1 Axes\_I** `const char Axes_I = 2 [static]`

Bit pattern for i axis for axes argument

**11.100.4.2 Axes\_X** `const char Axes_X = 1 [static]`

Bit pattern for x axis for axes argument

**11.100.4.3 Axes\_Y** `const char Axes_Y = 2 [static]`

Bit pattern for y axis for axes argument

**11.100.4.4 Axes\_Z** `const char Axes_Z = 1 [static]`

Bit pattern for z axis for axes argument

**11.100.4.5 Axis\_I** `const byte Axis_I = 1 [static]`

Axis number of i for axis argument

**11.100.4.6 Axis\_X** `const byte Axis_X = 0 [static]`

Axis number of x for axis argument

**11.100.4.7 Axis\_Y** `const byte Axis_Y = 1 [static]`

Axis number of y for axis argument

**11.100.4.8 Axis\_Z** `const byte Axis_Z = 0 [static]`

Axis number of z for axis argument

**11.100.4.9 McsBus\_XY** `const byte McsBus_XY = 1 [static]`

McsBus address for the xy-plane

**11.100.4.10 McsBus\_ZI** `const byte McsBus_ZI = 2 [static]`

McsBus address for the z and i axes

**11.100.4.11 RoboError\_AnotherMaster** `const uint32_t RoboError_AnotherMaster = ( (0xA0110000L) | 0x0005 ) [static]`

**11.101.2.1 CloseAllValves()** void CloseAllValves ( )

**11.101.2.2 GetPumpSpeed()** short GetPumpSpeed (   
 int *index* )

**11.101.2.3 GetSingleValve()** bool GetSingleValve (   
 int *valve* )

Query the state of a valve.

#### Parameters

<i>valve</i>	number of valve /*!
--------------	---------------------

#### Returns

state of the valve

**11.101.2.4 GetValve()** `int GetValve ( )`

Query the state of the values.

**Returns**

the current state of the valves as a bit pattern.

**11.101.2.5 IsPumpMotorOn()** `bool IsPumpMotorOn (`  
`int index )`**11.101.2.6 PumpOff()** `void PumpOff (`  
`int index )`**11.101.2.7 PumpOn()** `void PumpOn (`  
`int index,`  
`short speed )`**11.101.2.8 SetPumpSpeed()** `void SetPumpSpeed (`  
`int index,`  
`short speed )`**11.101.2.9 SetSingleValve()** `void SetSingleValve (`  
`int valve,`  
`bool onoff )`

Opens or Closes a valve.

**Parameters**

<i>valve</i>	number of valve to be changed /*!
<i>onoff</i>	open or close the valve

**11.101.2.10 SetValve()** `void SetValve (`  
`int value )`

Open or Close valves.

## Parameters

<i>value</i>	bit pattern of valves which should be open.
--------------	---

Inheritance diagram for CSafeISDeviceNet:

## Public Member Functions

- [CSafeISDeviceNet](#) (void)  
*Initializes a new instance of the [CSafeISDeviceNet](#) class.*
- [~CSafeISDeviceNet](#) (void)  
*Releases unmanaged resources and performs other cleanup operations before the [CSafeISDeviceNet](#) is reclaimed by garbage collection.*
- void [SetSwitches](#) (unsigned short switches)  
*Sets the switches for all electrodes on the device. Do not use during measurement*
- void [SetAdcChannels](#) (unsigned char channels)  
*Sets the ADC channels you want to be sampled*
- void [SetAdcSamplePos](#) (array< unsigned short >^ positions)  
*Sets the sample position of the ADC.*
- void [SetDacMode](#) (unsigned char mode)  
*Sets the DAC mode.*
- void [SetDacPulseform](#) (array< short >^ pulseform)  
*Sets the DAC pulseform.*
- void [SetDacPeriode](#) (unsigned int periode)  
*Sets the DAC periode.*

## Properties

- [CRoboDeviceNet](#)^ [RoboDevice](#) [get]  
*Gets the [CRoboDeviceNet](#). Use this to control the syringe.*
- [CFluidControlDeviceNet](#)^ [FluidControlDevice](#) [get]  
*Gets the [CFluidControlDeviceNet](#). Use this to control the valves. Only SetSingleValve is implemented for [CSafeISDeviceNet](#).*
- [CMcsUsbDacqNet](#)^ [DacqDevice](#) [get]  
*Gets the [CMcsUsbDacqNet](#). Use this to control the data aquisition.*

## Additional Inherited Members

### 11.105.1 Detailed Description

### 11.105.2 Constructor & Destructor Documentation

#### 11.105.2.1 [CSafeISDeviceNet](#)() [CSafeISDeviceNet](#) (void )

Initializes a new instance of the [CSafeISDeviceNet](#) class.

#### 11.105.2.2 [~CSafeISDeviceNet](#)() [~CSafeISDeviceNet](#) (void )

Releases unmanaged resources and performs other cleanup operations before the [CSafeISDeviceNet](#) is reclaimed by garbage collection.

### 11.105.3 Member Function Documentation

**11.105.3.1 SetAdcChannels()** `void SetAdcChannels ( unsigned char channels )`

Sets the ADC channels you want to be sampled

#### Parameters

<i>channels</i>	The bitmap of the 8 channels. Set bit to 1 for the channels you want measure
-----------------	--

**11.105.3.2 SetAdcSamplePos()** `void SetAdcSamplePos ( array< unsigned short >^ positions )`

Sets the sample position of the ADC.

#### Parameters

<i>positions</i>	The positions in units of 0.1µs.
------------------	----------------------------------

**11.105.3.3 SetDacMode()** `void SetDacMode ( unsigned char mode )`

Sets the DAC mode.

#### Parameters

<i>mode</i>	The mode: 0 = Impedance ; 1 = Amperometry
-------------	---

**11.105.3.4 SetDacPeriode()** `void SetDacPeriode ( unsigned int periode )`

Sets the DAC periode.

#### Parameters

<i>periode</i>	The periode in units of 10µs.
----------------	-------------------------------

**11.105.3.5 SetDacPulseform()** `void SetDacPulseform (`  
`array< short >^ pulseform )`

Sets the DAC pulseform.

#### Parameters

<i><code>pulseform</code></i>	The pulseform.
-------------------------------	----------------

**11.105.3.6 SetSwitches()** `void SetSwitches (`  
`unsigned short switches )`

Sets the switches for all electrodes on the device. Do not use during measurement

#### Parameters

<i><code>switches</code></i>	The switches: See Schematics for the meaning
------------------------------	--

## 11.105.4 Property Documentation

**11.105.4.1 DacqDevice** `CMcsUsbDacqNet^ DacqDevice [get]`

Gets the [CMcsUsbDacqNet](#). Use this to control the data aquisition.

**11.105.4.2 FluidControlDevice** `CFluidControlDeviceNet^ FluidControlDevice [get]`

Gets the [CFluidControlDeviceNet](#). Use this to control the valves. Only `SetSingleValve` is implemented for [CSafeISDeviceNet](#).

**11.105.4.3 RoboDevice** `CRoboDeviceNet^ RoboDevice [get]`

Gets the [CRoboDeviceNet](#). Use this to control the syringe.

## 11.106 CSCUDacqGroupChannelSelectionNet Class Reference

Inheritance diagram for `CSCUDacqGroupChannelSelectionNet`:

## 11.107 CSCUFunctionNet Class Reference

[CSCUFunctionNet](#) is the class to control the SCU device

Inheritance diagram for [CSCUFunctionNet](#):

## Public Member Functions

- delegate void [OnGetAvailableHeadstages](#) (uint32\_t AvailableHeadstages)
- delegate void [OnIsHeadstageAvailable](#) (uint32\_t Headstage, bool available)
- [CSCUFunctionNet](#) ([CMcsUsbNet](#)<sup>^</sup> mcsusb, [CMcsUsbFunctionPointerContainer](#)<sup>^</sup> pSCUFunctionPointerContainer)
  - Initializes a new instance of the [CSCUFunctionNet](#) class.*
- [CSCUFunctionNet](#) ([CMcsUsbNet](#)<sup>^</sup> mcsusb)
- virtual [~CSCUFunctionNet](#) ()
- [ICSCUFunctionNet](#) ()
- uint32\_t [GetAvailableHeadstages](#) ()
  - Gets a bitmap of available headstages.*
- bool [IsInDacqLegacyMode](#) ()
  - Is the SCU in legacy mode*
- void [SetDacqLegacyMode](#) (bool enable)
  - Enable the SCU legacy mode*
- uint32\_t [GetMaxStimulusChannelsPerHeadstage](#) ()
  - Gets the maximal number of stimulation channels a headstage can have.*
- uint32\_t [GetMaxNumberOfHeadstages](#) ()
  - Gets the maximal number of headstages.*
- [SCU\\_HeadstageIdEnumNet](#) [GetHeadstageID](#) (uint32\_t Headstage)

- Gets the headstage fpga ID.*

  - bool [IsHeadstageAvailable](#) (uint32\_t Headstage)

*Checks whether the given headstage is available.*
- void [PowerHS](#) (uint32\_t Headstage, bool power)

*Power the HS*

  - bool [IsHSPowered](#) (uint32\_t Headstage)

*Is the HS powered*

  - bool [HasHSPowerSwitch](#) ()

*Has SCU HS power switch*
- String ^ [GetHeadstageSerialNumber](#) (uint32\_t Headstage)

*Gets the serial number of a given headstage.*
- uint32\_t [GetHeadstageNumberOfAnalogChannels](#) (uint32\_t Headstage)

*Gets the number of analog channels for a given headstage.*
- uint32\_t [GetHeadstageNumberOfStimulationChannels](#) (uint32\_t Headstage)

*Gets the number of stimulation channels for a given headstage.*
- uint32\_t [GetHeadstageGainInPer mille](#) (uint32\_t Headstage)

*Gets the gain factor in per mille for a given headstage.*
- uint32\_t [GetHeadstageAdcRangeInMicroVolt](#) (uint32\_t Headstage)

*Gets the ADC Range in uV for a given headstage.*
- uint32\_t [GetHeadstageAdcBits](#) (uint32\_t Headstage)

*Gets the Number of ADC bits for a given headstage.*
- uint32\_t [GetHeadstageDacVoltageRangeInMilliVolt](#) (uint32\_t Headstage)

*Gets the DAC Voltage Range in mV for a given headstage.*
- uint32\_t [GetHeadstageDacVoltageResolutionInMicroVolt](#) (uint32\_t Headstage)

*Gets the DAC Voltage Resolution in uV for a given headstage.*
- uint32\_t [GetHeadstageDacCurrentRangeInMicroAmpere](#) (uint32\_t Headstage)

*Gets the DAC Current Range in uA for a given headstage.*
- uint32\_t [GetHeadstageDacCurrentResolutionInNanoAmpere](#) (uint32\_t Headstage)

*Gets the DAC Current Resolution in nA for a given headstage.*
- uint32\_t [GetHeadstageDacBits](#) (uint32\_t Headstage)

*Gets the Number of DAC bits for a given headstage.*
- uint32\_t [GetHeadstageSamplerate](#) (uint32\_t Headstage)

*Gets the Samplerate of a given headstage.*
- bool [GetHeadstagePowerStateAtStart](#) (uint32\_t Headstage)

*Gets the Power Status at SCU Power on of a given headstage.*
- void [SetHeadstagePowerStateAtStart](#) (uint32\_t Headstage, bool Powerstatus)

*Sets the Power Status at SCU Power on of a given headstage.*
- bool [HasGalvanicIsolation](#) ()

*Has galvanic isolated hardware*
- bool [HasAnalogOut](#) ()

*Has AnalogOut hardware*
- void [EnableAnalogOut](#) (bool enable)

*Enables AnalogOut globally*
- bool [IsAnalogOutEnabled](#) ()

*Is AnalogOut enabled*
- void [SetAnalogOutDACRange](#) (AnalogOut\_DAC\_Range\_EnumNet range)

*Sets the analog out DAC range*
- [AnalogOut\\_DAC\\_Range\\_EnumNet](#) [GetAnalogOutDACRange](#) ()

*Gets the analog out DAC range*
- void [SetAnalogOutADCRange](#) (uint32\_t range)

*Sets the analog out ADC range*

- uint32\_t [GetAnalogOutADCRange](#) ()  
*Gets the analog out ADC range*
- void [AutomaticAnalogOut](#) (bool automatic)  
*Sets automatic source channel selection*
- bool [IsAutomaticAnalogOut](#) ()  
*Is Automatic source channel selection selected*
- void [SetAnalogOutChannels](#) (uint32\_t out\_channel, uint32\_t source\_channel)  
*Set the source channel number for a certain output channel*
- uint32\_t [GetAnalogOutChannels](#) (uint32\_t out\_channel)  
*Get the connected source channel number for a certain output channel*
- void [SetReferenceElectrodeSwitchState](#) (uint32\_t Headstage, [ReferenceElectrodeSwitchPositionEnumNet](#) NewSwitchPos)  
*Sets the position of the switch for the reference electrode*
- [ReferenceElectrodeSwitchPositionEnumNet](#) [GetReferenceElectrodeSwitchState](#) (uint32\_t Headstage)  
*Gets the position of the switch for the reference electrode*
- void [SetReferenceElectrodeMode](#) (uint32\_t Headstage, [ReferenceElectrodeModeEnumNet](#) NewValue)  
*Sets the mode for the reference electrode*
- [ReferenceElectrodeModeEnumNet](#) [GetReferenceElectrodeMode](#) (uint32\_t Headstage)  
*Gets the mode for the reference electrode*
- [CFilterPropertyNet](#) ^ [GetFilterProperty](#) ([SCUDacqGroupChannelEnumNet](#) GroupID, uint32\_t FilterNumber)  
*Gets the filter property*
- array< [CFilterPropertyNet](#) ^ > ^ [GetFilterProperties](#) ([SCUDacqGroupChannelEnumNet](#) GroupID, int filter← Configurations\_Length)  
*Gets multiple filter properties*

## Events

- [OnGetAvailableHeadstages](#) ^ [GetAvailableHeadstagesEvent](#) [add, remove, raise]  
*Event fires when the bitmap of available headstages has changed*
- [OnIsHeadstageAvailable](#) ^ [IsHeadstageAvailableEvent](#) [add, remove, raise]  
*Event fires when 'true' if the headstage is connected for the headstage to query has changed*

## Additional Inherited Members

### 11.107.1 Detailed Description

[CSCUFunctionNet](#) is the class to control the SCU device

### 11.107.2 Constructor & Destructor Documentation

**11.107.2.1 CSCUFunctionNet()** [1/2] [CSCUFunctionNet](#) (  
[CMcsUsbNet](#) ^ mcsusb,  
[CMcsUsbFunctionPointerContainer](#) ^ pSCUFunctionPointerContainer )

Initializes a new instance of the [CSCUFunctionNet](#) class.

**11.107.2.2 CSCUFunctionNet()** [2/2] `CSCUFunctionNet (   
 CMcsUsbNet^ mcsusb )`

**11.107.2.3 ~CSCUFunctionNet()** `virtual ~CSCUFunctionNet ( ) [virtual]`

**11.107.2.4 !CSCUFunctionNet()** `!CSCUFunctionNet ( )`

### 11.107.3 Member Function Documentation

**11.107.3.1 AutomaticAnalogOut()** `void AutomaticAnalogOut (   
 bool automatic )`

Sets automatic source channel selection

#### Parameters

<i>automatic</i>	Automatic
------------------	-----------

**11.107.3.2 EnableAnalogOut()** `void EnableAnalogOut (   
 bool enable )`

Enables AnalogOut globally

#### Parameters

<i>enable</i>	Enable
---------------	--------

**11.107.3.3 GetAnalogOutADCRange()** `uint32_t GetAnalogOutADCRange ( )`

Gets the analog out ADC range

#### Returns

Range

**11.107.3.4 GetAnalogOutChannels()** `uint32_t GetAnalogOutChannels ( uint32_t out_channel )`

Get the connected source channel number for a certain output channel

#### Parameters

<i>out_channel</i>	Output channel number
--------------------	-----------------------

#### Returns

Source channel number

**11.107.3.5 GetAnalogOutDACRange()** `AnalogOut_DAC_Range_EnumNet GetAnalogOutDACRange ( )`

Gets the analog out DAC range

#### Returns

Range

**11.107.3.6 GetAvailableHeadstages()** `uint32_t GetAvailableHeadstages ( )`

Gets a bitmap of available headstages.

#### Returns

The bitmap of available headstages.

**11.107.3.7 GetFilterProperties()** `array<CFilterPropertyNet^> ^ GetFilterProperties ( SCUDacqGroupChannelEnumNet GroupID, int filterConfigurations_Length )`

Gets multiple filter properties

#### Parameters

<i>GroupID</i>	The group ID
<i>filterConfigurations_Length</i>	The maximal length of filterConfigurations.

**Returns**

array of filter properties

**11.107.3.8 GetFilterProperty()** `CFilterPropertyNet ^ GetFilterProperty (`  
    `SCUDacqGroupChannelEnumNet GroupID,`  
    `uint32_t FilterNumber )`

Gets the filter property

**Parameters**

<i>GroupID</i>	The group ID
<i>FilterNumber</i>	The filter number

**Returns**

The filter property

**11.107.3.9 GetHeadstageAdcBits()** `uint32_t GetHeadstageAdcBits (`  
    `uint32_t Headstage )`

Gets the Number of ADC bits for a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The number of bits the ADC has for the given headstage.

**11.107.3.10 GetHeadstageAdcRangeInMicroVolt()** `uint32_t GetHeadstageAdcRangeInMicroVolt (`  
    `uint32_t Headstage )`

Gets the ADC Range in uV for a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The ADC Range in uV for the given headstage.

**11.107.3.11 GetHeadstageDacBits()** `uint32_t GetHeadstageDacBits (uint32_t Headstage )`

Gets the Number of DAC bits for a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The number of bits the DAC has for the given headstage.

**11.107.3.12 GetHeadstageDacCurrentRangeInMicroAmpere()** `uint32_t GetHeadstageDacCurrentRangeInMicroAmpere (uint32_t Headstage )`

Gets the DAC Current Range in uA for a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The DAC Current Range in uA for the given headstage.

**11.107.3.13 GetHeadstageDacCurrentResolutionInNanoAmpere()** `uint32_t GetHeadstageDacCurrentResolutionInNanoAmpere (uint32_t Headstage )`

Gets the DAC Current Resolution in nA for a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The DAC Current Resolution in nA for the given headstage.

**11.107.3.14 GetHeadstageDacVoltageRangeInMilliVolt()** `uint32_t GetHeadstageDacVoltageRangeInMilliVolt ( uint32_t Headstage )`

Gets the DAC Voltage Range in mV for a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The DAC Voltage Range in mV for the given headstage.

**11.107.3.15 GetHeadstageDacVoltageResolutionInMicroVolt()** `uint32_t GetHeadstageDacVoltageResolutionInMicroVolt ( uint32_t Headstage )`

Gets the DAC Voltage Resolution in uV for a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The DAC Voltage Resolution in uV for the given headstage.

**11.107.3.16 GetHeadstageGainInPermille()** `uint32_t GetHeadstageGainInPermille ( uint32_t Headstage )`

Gets the gain factor in permille for a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The gain factor in permille for the given headstage.

**11.107.3.17 GetHeadstageID()** `SCU_HeadstageIdEnumNet GetHeadstageID (uint32_t Headstage )`

Gets the headstage fpga ID.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The headstage fpga ID.

**11.107.3.18 GetHeadstageNumberOfAnalogChannels()** `uint32_t GetHeadstageNumberOfAnalogChannels (uint32_t Headstage )`

Gets the number of analog channels for a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The number of analog channels the headstage has.

**11.107.3.19 GetHeadstageNumberOfStimulationChannels()** `uint32_t GetHeadstageNumberOfStimulationChannels (uint32_t Headstage )`

Gets the number of stimulation channels for a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The number of stimulation channels the headstage has.

**11.107.3.20 GetHeadstagePowerStateAtStart()** `bool GetHeadstagePowerStateAtStart ( uint32_t Headstage )`

Gets the Power Status at SCU Power on of a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The Power State at startup for the given headstage: bool false -> off, bool true -> on.

**11.107.3.21 GetHeadstageSamplerate()** `uint32_t GetHeadstageSamplerate ( uint32_t Headstage )`

Gets the Samplerate of a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The samplerate in Hz for the given headstage.

**11.107.3.22 GetHeadstageSerialNumber()** `String ^ GetHeadstageSerialNumber ( uint32_t Headstage )`

Gets the serial number of a given headstage.

**Parameters**

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

**Returns**

The serial number of the headstage.

**11.107.3.23 GetMaxNumberOfHeadstages()** `uint32_t GetMaxNumberOfHeadstages ( )`

Gets the maximal number of headstages.

**Returns**

The maximal number of headstages.

**11.107.3.24 GetMaxStimulusChannelsPerHeadstage()** `uint32_t GetMaxStimulusChannelsPerHeadstage ( )`

Gets the maximal number of stimulation channels a headstage can have.

**Returns**

The maximal number of stimulation channels a headstage can have.

**11.107.3.25 GetReferenceElectrodeMode()** `ReferenceElectrodeModeEnumNet GetReferenceElectrode↔  
Mode (   
 uint32_t Headstage )`

Gets the mode for the reference electrode

**Parameters**

<i>Headstage</i>	The headstage number
------------------	----------------------

**Returns**

The mode

**11.107.3.26 GetReferenceElectrodeSwitchState()** `ReferenceElectrodeSwitchPositionEnumNet Get↔  
ReferenceElectrodeSwitchState (   
 uint32_t Headstage )`

Gets the position of the switch for the reference electrode

**Parameters**

<i>Headstage</i>	The headstage number
------------------	----------------------

**Returns**

The switch position

**11.107.3.27 HasAnalogOut()** `bool HasAnalogOut ( )`

Has AnalogOut hardware

**Returns**

Enabled

**11.107.3.28 HasGalvanicIsolation()** `bool HasGalvanicIsolation ( )`

Has galvanic isolated hardware

**Returns**

Enabled

**11.107.3.29 HasHSPowerSwitch()** `bool HasHSPowerSwitch ( )`

Has SCU HS power switch

**Returns**

Has Switch

**11.107.3.30 IsAnalogOutEnabled()** `bool IsAnalogOutEnabled ( )`

Is AnalogOut enabled

**Returns**

Enabled

**11.107.3.31 IsAutomaticAnalogOut()** `bool IsAutomaticAnalogOut ( )`

Is Automatic source channel selection selected

**Returns**

Automatic

**11.107.3.32 IsHeadstageAvailable()** `bool IsHeadstageAvailable (   
uint32_t Headstage )`

Checks whether the given headstage is available.

## Parameters

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

## Returns

'true' if the headstage is connected.

**11.107.3.33 IsHSPowered()** `bool IsHSPowered (`  
    `uint32_t Headstage )`

Is the HS powered

## Parameters

<i>Headstage</i>	The headstage to query.
------------------	-------------------------

## Returns

'true' if the headstage is powered.

**11.107.3.34 IsInDacqLegacyMode()** `bool IsInDacqLegacyMode ( )`

Is the SCU in legacy mode

## Returns

Is Enabled

**11.107.3.35 OnGetAvailableHeadstages()** `delegate void OnGetAvailableHeadstages (`  
    `uint32_t AvailableHeadstages )`

**11.107.3.36 OnIsHeadstageAvailable()** `delegate void OnIsHeadstageAvailable (`  
    `uint32_t Headstage,`  
    `bool available )`

**11.107.3.37 PowerHS()** `void PowerHS (`  
    `uint32_t Headstage,`  
    `bool power )`

Power the HS

## Parameters

<i>Headstage</i>	The headstage to query.
<i>power</i>	'true' if the headstage is powered.

**11.107.3.38 SetAnalogOutADCRange()** `void SetAnalogOutADCRange (`  
`uint32_t range )`

Sets the analog out ADC range

## Parameters

<i>range</i>	Range
--------------	-------

**11.107.3.39 SetAnalogOutChannels()** `void SetAnalogOutChannels (`  
`uint32_t out_channel,`  
`uint32_t source_channel )`

Set the source channel number for a certain output channel

## Parameters

<i>out_channel</i>	Output channel number
<i>source_channel</i>	Source channel number

**11.107.3.40 SetAnalogOutDACRange()** `void SetAnalogOutDACRange (`  
`AnalogOut\_DAC\_Range\_EnumNet range )`

Sets the analog out DAC range

## Parameters

<i>range</i>	Range
--------------	-------

**11.107.3.41 SetDacqLegacyMode()** `void SetDacqLegacyMode (`  
`bool enable )`

Enable the SCU legacy mode

## Parameters

<i>enable</i>	Enable
---------------	--------

**11.107.3.42 SetHeadstagePowerStateAtStart()** `void SetHeadstagePowerStateAtStart (`  
     `uint32_t Headstage,`  
     `bool Powerstatus )`

Sets the Power Status at SCU Power on of a given headstage.

## Parameters

<i>Headstage</i>	The headstage number
<i>Powerstatus</i>	The Power State at startup for the given headstage: bool false -> off, bool true -> on.

**11.107.3.43 SetReferenceElectrodeMode()** `void SetReferenceElectrodeMode (`  
     `uint32_t Headstage,`  
     `ReferenceElectrodeModeEnumNet NewValue )`

Sets the mode for the reference electrode

## Parameters

<i>Headstage</i>	The headstage number
<i>NewValue</i>	The mode

**11.107.3.44 SetReferenceElectrodeSwitchState()** `void SetReferenceElectrodeSwitchState (`  
     `uint32_t Headstage,`  
     `ReferenceElectrodeSwitchPositionEnumNet NewSwitchPos )`

Sets the position of the switch for the reference electrode

## Parameters

<i>Headstage</i>	The headstage number
<i>NewSwitchPos</i>	The switch position

## 11.107.4 Event Documentation

**11.107.4.1 GetAvailableHeadstagesEvent** `OnGetAvailableHeadstages^ GetAvailableHeadstagesEvent [add], [remove], [raise]`

Event fires when the bitmap of available headstages has changed

**11.107.4.2 IsHeadstageAvailableEvent** `OnIsHeadstageAvailable^ IsHeadstageAvailableEvent [add], [remove], [raise]`

Event fires when 'true' if the headstage is connected for the headstage to query has changed

## 11.108 CSerialPortNet Class Reference

Inheritance diagram for CSerialPortNet:

### Public Member Functions

- `CSerialPortNet` (void)
- void `Send` (array< byte >^ buffer)
- void `Send` (String^ command)
- array< byte > ^ `Receive` (void)
- array< byte > ^ `Receive` (int length)
- String ^ `ReceiveString` (void)
- String ^ `ReceiveString` (int length)
- int `GetBytesAvailable` (void)

### Additional Inherited Members

#### 11.108.1 Constructor & Destructor Documentation

**11.108.1.1 CSerialPortNet()** `CSerialPortNet ( void )`

#### 11.108.2 Member Function Documentation

**11.108.2.1 GetBytesAvailable()** `int GetBytesAvailable (`  
`void )`

**11.108.2.2 Receive()** [1/2] `array<byte> ^ Receive (`  
`int length )`

**11.108.2.3 Receive()** [2/2] `array<byte> ^ Receive (`

`void )`

**11.108.2.6 Send()** [1/2] `void Send (`  
`array< byte > ^ buffer )`

**11.108.2.7 Send()** [2/2] `void Send (`  
`String ^ command )`

## 11.109 CStg200xBasicNet Class Reference

Base class for the Stg200x.

Inheritance diagram for CStg200xBasicNet:

## Public Member Functions

- virtual [~CStg200xBasicNet](#) ()  
*The destructor.*
- void [SetOutputRate](#) (uint32\_t rate)  
*Change the output rate of the STG. Valid rates are from 1000 Hz to 50000 Hz.*
- uint32\_t [GetOutputRate](#) ()  
*Queries the output rate of the STG. Valid rates are from 1000 Hz to 50000 Hz.*
- void [SendStart](#) (uint32\_t triggermap)  
*Start (Trigger) the STG. The startup delay is in the range of a few ms.*
- void [SendStop](#) (uint32\_t triggermap)  
*Stop some or all triggers of the STG.*
- void [SendStop](#) (uint32\_t triggermap, int options)  
*Stop some or all triggers of the STG.*
- void [GetStgVersionInfo](#) ([Out]String^% SwVersion, [Out]String^% HwVersion)  
*Queries software and hardware version.*
- void [GetAnalogRanges](#) (int channel, [Out]int% URange, [Out]int% IRange)  
*Gets the range of the analog outputs.*
- void [GetAnalogResolution](#) (int channel, [Out]int% URes, [Out]int% IRes)  
*Gets the resolution of the analog outputs.*
- virtual int32\_t [GetDACResolution](#) ()  
*Gets number of bits of the DAC resolution.*
- virtual int32\_t [GetVoltageRangeInMicroVolt](#) (uint32\_t channel)  
*Gets the Voltage Range of the specified channel in Microvolts.*
- virtual int32\_t [GetVoltageResolutionInMicroVolt](#) (uint32\_t channel)  
*Gets the Voltage Resolution of the specified channel in Microvolts.*
- virtual int32\_t [GetCurrentRangeInNanoAmp](#) (uint32\_t channel)  
*Gets the Current Range of the specified channel in Nanoamps.*
- virtual int32\_t [GetCurrentResolutionInNanoAmp](#) (uint32\_t channel)  
*Gets the Current Resolution of the specified channel in Nanoamps.*
- void [GetStgProgramInfo](#) ([Out]bool% IsProgrammed, [Out]System::Runtime::InteropServices::ComTypes::↵  
FILETIME% timestamp, [Out]String^% filename, [Out]Guid% guid)  
*Queries Download information from the STG. If download information was stored by the use of [SetStgProgramInfo](#),  
this function can be used to retrieve it.*
- void [GetStgProgramInfo](#) ([Out]bool% IsProgrammed, [Out]DateTime% timestamp, [Out]String^% filename,  
[Out]Guid% guid)  
*Queries Download information from the STG. If download information was stored by the use of [SetStgProgramInfo](#),  
this function can be used to retrieve it.*
- void [SetStgProgramInfo](#) (DateTime timestamp, String^ filename, Guid guid)  
*Store Download information in the STG. This function can be used to store the filename and timestamp of the last  
download for later query.*
- uint32\_t [GetAvailableMemory](#) ()  
*Gets the amount of memory available in the currently selected segment of the STG.*
- uint32\_t [GetTotalMemory](#) ()  
*Gets the total amount of memory available on the STG (all segments).*
- virtual uint32\_t [GetNumberOfAnalogChannels](#) ()  
*Gets the Number of available analog channels of the device.*
- virtual uint32\_t [GetNumberOfSyncoutChannels](#) ()  
*Gets the Number of available syncout channels of the device.*
- virtual uint32\_t [GetNumberOfTriggerInputs](#) ()  
*Gets the Number of trigger inputs of the device.*
- virtual uint32\_t [GetNumberOfHWDACPaths](#) ()

- Gets the Number of HW Stimulation DACs of the device.*

  - virtual uint32\_t [GetNumberOfStimulationSourcesPerElectrode](#) ()
- Gets the number of stimulation sources (DACs) per electrode.*

  - virtual void [SetVoltageMode](#) (unsigned int channel)
- Sets a channel to voltage mode (STG3008-FA and STG400x only).*

  - virtual void [SetCurrentMode](#) (unsigned int channel)
- Sets a channel to current mode (STG3008-FA and STG400x only).*

  - virtual void [SetVoltageMode](#) ()
- Sets all channels to voltage mode (STG3008-FA and STG400x only).*

  - virtual void [SetCurrentMode](#) ()
- Sets all channels to current mode (STG3008-FA and STG400x only).*

  - virtual uint32\_t [GetCurrentRangeByIndex](#) (uint32\_t channel)
- Gets the currently selected range index for the current output (STG5 only).*

  - virtual void [SetCurrentRangeByIndex](#) (uint32\_t channel, uint32\_t rangeIndex)
- Sets the range index for the current output (STG5 only).*

  - virtual void [SetMeasurementMode](#) (unsigned int channel)
- Sets a channel to measurement mode (STG3008-FA).*

  - virtual void [SetFAAmplification](#) (unsigned int amplification)
- Gets the FA amplification.*

  - virtual uint32\_t [GetFAAmplification](#) ()
- Sets the autocalibration disabled.*

  - virtual void [SetAutocalibrationDisabled](#) (unsigned int channel, bool disable)
- Gets the autocalibration configuration.*

  - virtual bool [GetAutocalibrationDisabled](#) (unsigned int channel)
- Gets the autocalibration configuration.*

  - virtual void [SetElectrodeMode](#) (uint32\_t electrode, array< [ElectrodeModeEnumNet](#) >^ mode)
- Puts an electrode in either automatic or manual mode.*

  - virtual void [SetElectrodeMode](#) (uint32\_t electrode, [ElectrodeModeEnumNet](#) mode)
- Puts an electrode in either automatic or manual mode.*

  - virtual void [SetElectrodeMode](#) (uint32\_t Scu\_HS, uint32\_t electrode, array< [ElectrodeModeEnumNet](#) >^ mode)
- Puts an electrode in either automatic or manual mode.*

  - virtual void [SetElectrodeMode](#) (uint32\_t Scu\_HS, uint32\_t electrode, [ElectrodeModeEnumNet](#) mode)
- Puts an electrode in either automatic or manual mode.*

  - virtual uint32\_t [GetElectrodeMode](#) (uint32\_t electrode)
- Gets the mode an electrode is in.*

  - virtual uint32\_t [GetElectrodeMode](#) (uint32\_t Scu\_HS, uint32\_t electrode)
- Gets the mode an electrode is in.*

  - virtual void [SetElectrodeDacMux](#) (uint32\_t electrode, uint32\_t listModelIndex, array< [ElectrodeDacMuxEnumNet](#) >^ dacMux)
- Defines the DAC to use for an electrode.*

  - virtual void [SetElectrodeDacMux](#) (uint32\_t electrode, uint32\_t listModelIndex, [ElectrodeDacMuxEnumNet](#) dacMux)
- Defines the DAC to use for an electrode.*

  - virtual void [SetElectrodeDacMux](#) (uint32\_t Scu\_HS, uint32\_t electrode, uint32\_t listModelIndex, [ElectrodeDacMuxEnumNet](#) dacMux)
- Defines the DAC to use for an electrode.*

  - virtual void [SetElectrodeDacMux](#) (uint32\_t Scu\_HS, uint32\_t electrode, uint32\_t listModelIndex, array< [ElectrodeDacMuxEnumNet](#) >^ dacMux)
- Defines the DAC to use for an electrode.*

  - virtual [ElectrodeDacMuxEnumNet](#) [GetElectrodeDacMux](#) (uint32\_t electrode, uint32\_t listModelIndex)
- Gets the DAC which is used for an electrode.*

  - virtual [ElectrodeDacMuxEnumNet](#) [GetElectrodeDacMux](#) (uint32\_t Scu\_HS, uint32\_t electrode, uint32\_t listModelIndex)

- Gets the DAC which is used for an electrode.*

  - virtual void [SetElectrodeEnable](#) (uint32\_t electrode, uint32\_t listmodelIndex, array< bool >^ enable)

*Enables or disables the stimulation switch for an electrode.*
- virtual void [SetElectrodeEnable](#) (uint32\_t electrode, uint32\_t listmodelIndex, bool enable)

*Enables or disables the stimulation switch for an electrode.*
- virtual void [SetElectrodeEnable](#) (uint32\_t Scu\_HS, uint32\_t electrode, uint32\_t listmodelIndex, bool enable)

*Enables or disables the stimulation switch for an electrode.*
- virtual void [SetElectrodeEnable](#) (uint32\_t Scu\_HS, uint32\_t electrode, uint32\_t listmodelIndex, array< bool >^ enable)

*Enables or disables the stimulation switch for an electrode.*
- virtual bool [GetElectrodeEnable](#) (uint32\_t electrode, uint32\_t listmodelIndex)

*Gets whether an electrode is enabled or disabled for stimulation.*
- virtual bool [GetElectrodeEnable](#) (uint32\_t Scu\_HS, uint32\_t electrode, uint32\_t listmodelIndex)

*Gets whether an electrode is enabled or disabled for stimulation.*
- virtual void [SetExternalElectrodeEnable](#) (uint32\_t electrode, uint32\_t listmodelIndex, array< bool >^ enable)

*Enables or disables the stimulation switch for an external electrode.*
- virtual void [SetExternalElectrodeEnable](#) (uint32\_t electrode, uint32\_t listmodelIndex, bool enable)

*Enables or disables the stimulation switch for an external electrode.*
- virtual bool [GetExternalElectrodeEnable](#) (uint32\_t electrode, uint32\_t listmodelIndex)

*Gets whether an electrode is enabled or disabled for stimulation.*
- virtual void [SetBlankingEnable](#) (uint32\_t electrode, bool enable)

*Defines whether an electrode should be blanked while stimulation is in progress.*
- virtual void [SetBlankingEnable](#) (uint32\_t electrode, array< bool >^ enable)

*Defines whether an electrode should be blanked while stimulation is in progress.*
- virtual void [SetBlankingEnable](#) (uint32\_t Scu\_HS, uint32\_t electrode, bool enable)

*Defines whether an electrode should be blanked while stimulation is in progress.*
- virtual void [SetBlankingEnable](#) (uint32\_t Scu\_HS, uint32\_t electrode, array< bool >^ enable)

*Defines whether an electrode should be blanked while stimulation is in progress.*
- virtual bool [GetBlankingEnable](#) (uint32\_t electrode)

*Gets whether an electrode should be blanked while stimulation is in progress.*
- virtual bool [GetBlankingEnable](#) (uint32\_t Scu\_HS, uint32\_t electrode)

*Gets whether an electrode should be blanked while stimulation is in progress.*
- virtual void [SetEnableAmplifierProtectionSwitch](#) (uint32\_t electrode, bool enable)

*Defines whether the Amplifier Protection Switch is openend while stimulation is in progress.*
- virtual void [SetEnableAmplifierProtectionSwitch](#) (uint32\_t electrode, array< bool >^ enable)

*Defines whether the Amplifier Protection Switch is openend while stimulation is in progress.*
- virtual void [SetEnableAmplifierProtectionSwitch](#) (uint32\_t Scu\_HS, uint32\_t electrode, bool enable)

*Defines whether the Amplifier Protection Switch is openend while stimulation is in progress.*
- virtual void [SetEnableAmplifierProtectionSwitch](#) (uint32\_t Scu\_HS, uint32\_t electrode, array< bool >^ enable)

*Defines whether the Amplifier Protection Switch is openend while stimulation is in progress.*
- virtual bool [GetEnableAmplifierProtectionSwitch](#) (uint32\_t electrode)

*Gets whether the Amplifier Protection Switch is openend while stimulation is in progress.*
- virtual bool [GetEnableAmplifierProtectionSwitch](#) (uint32\_t Scu\_HS, uint32\_t electrode)

*Gets whether the Amplifier Protection Switch is openend while stimulation is in progress.*
- virtual uint32\_t [GetNumberOfStimulationElectrodes](#) ()
- template<typename digitalsourceenum >
  - virtual void [SetTriggerSource](#) (unsigned int triggernum, [DigitalSource](#)< digitalsourceenum >^ triggersource, int bitnum\_offset)
- virtual void [SetTriggerSource](#) (unsigned int triggernum, [TriggerSourceEnumNet](#) triggersource, int bitnum\_offset)
- virtual void [SetTriggerSource](#) (unsigned int triggernum, [TriggerSourceEnumNet](#) triggersource)

- virtual [TriggerSourceEnumNet GetTriggerSource](#) (unsigned int triggernum)
- virtual void [SetListmodeIndexRange](#) (unsigned int electrodeGroup, unsigned int startIndex, unsigned int endIndex, unsigned int mode)
 

*Define the range of list mode indexes to use for the given electrode group.*
- virtual void [GetListmodeIndexRange](#) (unsigned int electrodeGroup, unsigned int &startIndex, unsigned int &endIndex, unsigned int &mode)
 

*Query the range of list mode indexes to use for the given electrode group.*
- virtual void [SetListmodeTriggerSource](#) (unsigned int electrodeGroup, [TriggerSourceEnumNet](#) triggersource)
 

*Define the signal which triggers the transition from one list mode entry to the next. After reaching the last entry in the list, the first entry is selected. For triggersource use the Enum which corresponds to the device in use, for example use SCUDigitalSourceEnumNet and cast to TriggerSourceEnumNet if working with an SCU device.*
- virtual void [SetListmodeTriggerSource](#) (unsigned int electrodeGroup, [TriggerSourceEnumNet](#) triggersource, int bitnumOffset)
 

*Define the signal which triggers the transition from one list mode entry to the next. After reaching the last entry in the list, the first entry is selected. For triggersource use the Enum which corresponds to the device in use, for example use SCUDigitalSourceEnumNet and cast to TriggerSourceEnumNet if working with an SCU device.*
- virtual [TriggerSourceEnumNet GetListmodeTriggerSource](#) (unsigned int electrodeGroup)
 

*Query the currently active signal which triggers the transition from one list mode entry to the next. For triggersource use the Enum which corresponds to the device in use, for example use SCUDigitalSourceEnumNet and cast to TriggerSourceEnumNet if working with an SCU device.*
- virtual void [ListModeSendStart](#) (unsigned int electrodeGroupMask)
 

*Activate (arm) the Listmode for the selected electrode groups.*
- virtual void [ListModeSendStop](#) (unsigned int electrodeGroupMask)
 

*Deactivate the Listmode for the selected electrode groups.*
- virtual void [SetHeadstage](#) (unsigned int headstage)
- virtual uint32\_t [GetHeadstage](#) ()
- virtual void [SetDacAmplificationFactor](#) (uint32\_t DacNumber, double Factor)
 

*Set the amplification factor for a DAC.*
- virtual double [GetDacAmplificationFactor](#) (uint32\_t DacNumber)
 

*Get the amplification factor for a DAC.*
- virtual void [SetDigoutMode](#) ([Stg200xDigoutModeEnumNet](#) digoutMode)
 

*Sets the operation mode of the digital output port, can be Monitor, Manual or SyncOut*
- virtual [Stg200xDigoutModeEnumNet GetDigoutMode](#) ()
 

*Gets the operation mode of the digital output port, can be Monitor, Manual or SyncOut*
- virtual void [SetDigoutValue](#) (uint32\_t digoutValue)
 

*Sets the Value on the digital output port when in manual mode.*
- virtual uint32\_t [GetDigoutValue](#) ()
 

*Gets the Value on the digital output port.*
- virtual uint32\_t [GetDiginValue](#) ()
 

*Gets the Value on the digital input port.*
- virtual void [SetSyncoutMap](#) (uint32\_t channel, uint32\_t syncoutMap)
 

*Sets the mapping between external syncout outputs and internal syncout channels.*
- virtual uint32\_t [GetSyncoutMap](#) (uint32\_t channel)
 

*Gets the mapping between external syncout outputs and internal syncout channels.*

## Additional Inherited Members

### 11.109.1 Detailed Description

Base class for the Stg200x.

From this class all STG related classes are derived: [Mcs.Usb.CStg200xDownloadBasicNet](#) [Mcs.Usb.CStg200xDownloadNet](#) for [Download Mode](#) and [Mcs.Usb.CStg200xStreamingNet](#) for [Streaming Mode](#).

[CStg200xBasicNet](#) is the base class to control MCS STG device.

## 11.109.2 Constructor & Destructor Documentation

### 11.109.2.1 `~CStg200xBasicNet()` `virtual ~CStg200xBasicNet ( ) [virtual]`

The destructor.

## 11.109.3 Member Function Documentation

### 11.109.3.1 `GetAnalogRanges()` `void GetAnalogRanges (` `int channel,` `[Out] int% URange,` `[Out] int% IRange )`

Gets the range of the analog outputs.

#### Parameters

<i>channel</i>	The channel which is queried.
<i>URange</i>	The Voltage range in mV.
<i>IRange</i>	The Current range in uA.

### 11.109.3.2 `GetAnalogResolution()` `void GetAnalogResolution (` `int channel,` `[Out] int% URes,` `[Out] int% IRes )`

Gets the resolution of the analog outputs.

#### Parameters

<i>channel</i>	The channel which is queried.
<i>URes</i>	The Voltage resolution in mV.
<i>IRes</i>	The Current resolution in uA.

### 11.109.3.3 `GetAutocalibrationDisabled()` `virtual bool GetAutocalibrationDisabled (` `unsigned int channel ) [virtual]`

Gets the autocalibration configuration.

**Parameters**

<i>channel</i>	The channel number.
----------------	---------------------

**Returns**

`true` if autocalibration is disabled.

**11.109.3.4 GetAvailableMemory()** `uint32_t GetAvailableMemory ( )`

Gets the amount of memory available in the currently selected segment of the STG.

**Returns**

The memory available in the currently selected segment in bytes.

**11.109.3.5 GetBlankingEnable()** [1/2] `virtual bool GetBlankingEnable ( uint32_t electrode ) [virtual]`

Gets whether an electrode should be blanked while stimulation is in progress.

**Parameters**

<i>electrode</i>	The electrode number.
------------------	-----------------------

**Returns**

`true` if blanking is enabled while stimulation is in progress.

**11.109.3.6 GetBlankingEnable()** [2/2] `virtual bool GetBlankingEnable ( uint32_t Scu_HS, uint32_t electrode ) [virtual]`

Gets whether an electrode should be blanked while stimulation is in progress.

**Parameters**

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

## Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

## Returns

true if blanking is enabled while stimulation is in progress.

**11.109.3.7 GetCurrentRangeByIndex()** `virtual uint32_t GetCurrentRangeByIndex (uint32_t channel) [virtual]`

Gets the currently selected range index for the current output (STG5 only).

## Parameters

<i>channel</i>	The channel to change.
----------------	------------------------

## Returns

The currently selected range index.

**11.109.3.8 GetCurrentRangeInNanoAmp()** `virtual int32_t GetCurrentRangeInNanoAmp (uint32_t channel) [virtual]`

Gets the Current Range of the specified channel in Nanoamps.

## Parameters

<i>channel</i>	Channel which is queried.
----------------	---------------------------

## Returns

The Current Range of the specified channel in Nanoamps.

**11.109.3.9 GetCurrentResolutionInNanoAmp()** `virtual int32_t GetCurrentResolutionInNanoAmp (uint32_t channel) [virtual]`

Gets the Current Resolution of the specified channel in Nanoamps.

## Parameters

<i>channel</i>	Channel which is queried.
----------------	---------------------------

**Returns**

The Current Resolution of the specified channel in Nanoamps.

**11.109.3.10 GetDacAmplificationFactor()** `virtual double GetDacAmplificationFactor ( uint32_t DacNumber ) [virtual]`

Get the amplification factor for a DAC.

**Parameters**

<i>DacNumber</i>	The number of the DAC.
------------------	------------------------

**Returns**

the amplification factor for the DAC queried, range is from -1.99999 to +1.99999.

**11.109.3.11 GetDACResolution()** `virtual int32_t GetDACResolution ( ) [virtual]`

Gets number of bits of the DAC resolution.

**Returns**

The DAC resolution in bits.

**11.109.3.12 GetDiginValue()** `virtual uint32_t GetDiginValue ( ) [virtual]`

Gets the Value on the digital input port.

**Returns**

The current value on the digital inputs.

**11.109.3.13 GetDigoutMode()** `virtual Stg200xDigoutModeEnumNet GetDigoutMode ( ) [virtual]`

Gets the operation mode of the digital output port, can be Monitor, Manual or SyncOut

**Returns**

The current operation mode.

**11.109.3.14 GetDigoutValue()** `virtual uint32_t GetDigoutValue ( ) [virtual]`

Gets the Value on the digital output port.

**Returns**

The current value on the digital outputs.

**11.109.3.15 GetElectrodeDacMux()** [1/2] `virtual ElectrodeDacMuxEnumNet GetElectrodeDacMux ( uint32_t electrode, uint32_t listmodeIndex ) [virtual]`

Gets the DAC which is used for an electrode.

**Parameters**

<i>electrode</i>	The electrode number.
<i>listmodeIndex</i>	The index for listmode.

**Returns**

The DAC in use, can be 1, 2 or 3. If the electrode is grounded 0 is returned.

**11.109.3.16 GetElectrodeDacMux()** [2/2] `virtual ElectrodeDacMuxEnumNet GetElectrodeDacMux ( uint32_t Scu_HS, uint32_t electrode, uint32_t listmodeIndex ) [virtual]`

Gets the DAC which is used for an electrode.

**Parameters**

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

**Parameters**

<i>electrode</i>	The electrode number.
<i>listmodeIndex</i>	The index for listmode.

**Returns**

The DAC in use, can be 1, 2 or 3. If the electrode is grounded 0 is returned.

**11.109.3.17 GetElectrodeEnable()** [1/2] `virtual bool GetElectrodeEnable (`  
    `uint32_t electrode,`  
    `uint32_t listmodeIndex ) [virtual]`

Gets whether an electrode is enabled or disabled for stimulation.

**Parameters**

<i>electrode</i>	The electrode number.
<i>listmodeIndex</i>	The index for listmode.

**Returns**

true if the electrode is enabled, false if it is disabled.

**11.109.3.18 GetElectrodeEnable()** [2/2] `virtual bool GetElectrodeEnable (`  
    `uint32_t Scu_HS,`  
    `uint32_t electrode,`  
    `uint32_t listmodeIndex ) [virtual]`

Gets whether an electrode is enabled or disabled for stimulation.

**Parameters**

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

**Parameters**

<i>electrode</i>	The electrode number.
<i>listmodeIndex</i>	The index for listmode.

**Returns**

true if the electrode is enabled, false if it is disabled.

**11.109.3.19 GetElectrodeMode()** [1/2] `virtual uint32_t GetElectrodeMode (`  
    `uint32_t electrode ) [virtual]`

Gets the mode an electrode is in.

**Parameters**

<i>electrode</i>	The electrode number.
------------------	-----------------------

**Returns**

0 for automatic and 3 for manual mode.

**11.109.3.20 GetElectrodeMode()** [2/2] `virtual uint32_t GetElectrodeMode (`  
    `uint32_t Scu_HS,`  
    `uint32_t electrode ) [virtual]`

Gets the mode an electrode is in.

**Parameters**

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

**Parameters**

<i>electrode</i>	The electrode number.
------------------	-----------------------

**Returns**

0 for automatic and 3 for manual mode.

**11.109.3.21 GetEnableAmplifierProtectionSwitch()** [1/2] `virtual bool GetEnableAmplifierProtection↔`  
`Switch (`  
    `uint32_t electrode ) [virtual]`

Gets whether the Amplifier Protection Switch is openend while stimulation is in progress.

**Parameters**

<i>electrode</i>	The electrode number.
------------------	-----------------------

**Returns**

true if the switch is to be opened, false if it is closed while stimulation is in progress.

**11.109.3.22 GetEnableAmplifierProtectionSwitch()** [2/2] `virtual bool GetEnableAmplifierProtectionSwitch (`  
`uint32_t Scu_HS,`  
`uint32_t electrode ) [virtual]`

Gets whether the Amplifier Protection Switch is openend while stimulation is in progress.

#### Parameters

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

#### Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

#### Returns

true if the switch is to be opened, false if it is closed while stimulation is in progress.

**11.109.3.23 GetExternalElectrodeEnable()** `virtual bool GetExternalElectrodeEnable (`  
`uint32_t electrode,`  
`uint32_t listmodeIndex ) [virtual]`

Gets weather an electrode is enabled or disabled for stimulation.

#### Parameters

<i>electrode</i>	The electrode number.
<i>listmodeIndex</i>	The index for listmode.

#### Returns

true if the electrode is enabled, false if it is disabled.

**11.109.3.24 GetFAAmplification()** `virtual uint32_t GetFAAmplification ( ) [virtual]`

**11.109.3.25 GetHeadstage()** `virtual uint32_t GetHeadstage ( ) [virtual]`

**11.109.3.26 GetListModelIndexRange()** `virtual void GetListModelIndexRange ( unsigned int electrodeGroup, unsigned int & startIndex, unsigned int & endIndex, unsigned int & mode ) [virtual]`

Query the range of list mode indexes to use for the given electrode group.

#### Parameters

<i>electrodeGroup</i>	The electrodegroup for which the range is queried.
-----------------------	--

#### Parameters

<i>startIndex</i>	The index of the first active element in the listmode list.
<i>endIndex</i>	The index of the last active element in the listmode list.
<i>mode</i>	0 for "start with startIndex", 1 for "start with endIndex".

**11.109.3.27 GetListModelTriggerSource()** `virtual TriggerSourceEnumNet GetListModelTriggerSource ( unsigned int electrodeGroup ) [virtual]`

Query the currently active signal which triggers the transition from one list mode entry to the next. For triggersource use the Enum which corresponds to the device in use, for example use SCUDigitalSourceEnumNet and cast to TriggerSourceEnumNet if working with an SCU device.

#### Parameters

<i>electrodeGroup</i>	The electrodegroup for which the triggersource is queried.
-----------------------	--

#### Returns

One of the possible sources for the transition.

**11.109.3.28 GetNumberOfAnalogChannels()** `virtual uint32_t GetNumberOfAnalogChannels ( ) [virtual]`

Gets the Number of available analog channels of the device.

#### Returns

The number of analog channels.

**11.109.3.29 GetNumberOfHWDACPaths()** `virtual uint32_t GetNumberOfHWDACPaths ( ) [virtual]`

Gets the Number of HW Stimulation DACs of the device.

**Returns**

The number of independent HW Stimulation outputs.

**11.109.3.30 GetNumberOfStimulationElectrodes()** `virtual uint32_t GetNumberOfStimulationElectrodes ( ) [virtual]`

**11.109.3.31 GetNumberOfStimulationSourcesPerElectrode()** `virtual uint32_t GetNumberOfStimulationSourcesPerElectrode ( ) [virtual]`

Gets the number of stimulation sources (DACs) per electrode.

**Returns**

The number of stimulation sources (DACs) per electrode.

**11.109.3.32 GetNumberOfSyncoutChannels()** `virtual uint32_t GetNumberOfSyncoutChannels ( ) [virtual]`

Gets the Number of available syncout channels of the device.

**Returns**

The number of analog channels.

**11.109.3.33 GetNumberOfTriggerInputs()** `virtual uint32_t GetNumberOfTriggerInputs ( ) [virtual]`

Gets the Number of trigger inputs of the device.

**Returns**

The number of trigger inputs.

**11.109.3.34 GetOutputRate()** `uint32_t GetOutputRate ( )`

Queries the output rate of the STG. Valid rates are from 1000 Hz to 50000 Hz.

**Returns**

Returns the current output rate in Hz.

**11.109.3.35 GetStgProgramInfo()** [1/2] `void GetStgProgramInfo ( [Out] bool% IsProgrammed, [Out] DateTime% timestamp, [Out] String^% filename, [Out] Guid% guid )`

Queries Download information from the STG. If download information was stored by the use of [SetStgProgramInfo](#), this function can be used to retrieve it.

## Parameters

<i>IsProgrammed</i>	Flag wether download information is valid.
<i>timestamp</i>	The timestamp of last download.
<i>filename</i>	The filename of the downloaded waveform.
<i>guid</i>	A GUID.

**11.109.3.36 GetStgProgramInfo()** [2/2] `void GetStgProgramInfo (`  
`[Out] bool% IsProgrammed,`  
`[Out] System::Runtime::InteropServices::ComTypes::FILETIME% timestamp,`  
`[Out] String^% filename,`  
`[Out] Guid% guid )`

Queries Download information from the STG. If download information was stored by the use of [SetStgProgramInfo](#), this function can be used to retrieve it.

## Parameters

<i>IsProgrammed</i>	Flag wether download information is valid.
<i>timestamp</i>	The timestamp of last download.
<i>filename</i>	The filename of the downloaded waveform.

**11.109.3.37 GetStgVersionInfo()** `void GetStgVersionInfo (`  
`[Out] String^% SwVersion,`  
`[Out] String^% HwVersion )`

Queries software and hardware version.

## Parameters

<i>SwVersion</i>	The current Software Version of the STG.
<i>HwVersion</i>	The Hardware Revision of the STG.

**11.109.3.38 GetSyncoutMap()** `virtual uint32_t GetSyncoutMap (`  
`uint32_t channel ) [virtual]`

Gets the mapping between external syncout outputs and internal syncout channels.

## Parameters

<i>channel</i>	The external syncout output channel number (zero based).
----------------	--

**Returns**

The bitmap of internal syncout channels mapped to channel.

**11.109.3.39 GetTotalMemory()** `uint32_t GetTotalMemory ( )`

Gets the total amount of memory available on the STG (all segments).

**Returns**

The total memory available on the STG in bytes.

**11.109.3.40 GetTriggerSource()** `virtual TriggerSourceEnumNet GetTriggerSource ( unsigned int triggernum ) [virtual]`**11.109.3.41 GetVoltageRangeInMicroVolt()** `virtual int32_t GetVoltageRangeInMicroVolt ( uint32_t channel ) [virtual]`

Gets the Voltage Range of the specified channel in Microvolts.

**Parameters**

<i>channel</i>	Channel which is queried.
----------------	---------------------------

**Returns**

The Voltage Range of the specified channel in Microvolts.

**11.109.3.42 GetVoltageResolutionInMicroVolt()** `virtual int32_t GetVoltageResolutionInMicroVolt ( uint32_t channel ) [virtual]`

Gets the Voltage Resolution of the specified channel in Microvolts.

**Parameters**

<i>channel</i>	Channel which is queried.
----------------	---------------------------

**Returns**

The Voltage Resolution of the specified channel in Microvolts.

**11.109.3.43 ListModeSendStart()** virtual void ListModeSendStart (   
 unsigned int *electrodeGroupMask* ) [virtual]

Activate (arm) the Listmode for the selected electrode groups.

Parameters

<i>electrodeGroupMask</i>	The bitmask of electrode groups for which the listmode is activated.
---------------------------	--

**11.109.3.44 ListModeSendStop()** virtual void ListModeSendStop (   
 unsigned int *electrodeGroupMask* ) [virtual]

Deactivate the Listmode for the selected electrode groups.

Parameters

<i>electrodeGroupMask</i>	The bitmask of electrodegroups for which the listmode is deactivated.
---------------------------	---

**11.109.3.45 SendStart()** void SendStart (   
 uint32\_t *triggermap* )

Start (Trigger) the STG. The startup delay is in the range of a few ms.

Parameters

<i>triggermap</i>	A bitmap of triggers which will be started.
-------------------	---

**11.109.3.46 SendStop()** [1/2] void SendStop (   
 uint32\_t *triggermap* )

Stop some or all triggers of the STG.

Parameters

<i>triggermap</i>	A bitmap of triggers which will be stopped.
-------------------	---

**11.109.3.47 SendStop() [2/2]** `void SendStop (`  
`uint32_t triggermap,`  
`int options )`

Stop some or all triggers of the STG.

#### Parameters

<i>triggermap</i>	A bitmap of triggers which will be stopped.
<i>options</i>	bitmap of options, currently only STOP_OPTION_SAVESTOP (0x80) is defined, which bypasses the stop commands when a syncout associated with a given sync-out has bit 1 (0x02) set. Can be used e.g. to prevent a stop while a biphasic stimulation pulse is active..

**11.109.3.48 SetAutocalibrationDisabled()** `virtual void SetAutocalibrationDisabled (`  
`unsigned int channel,`  
`bool disable ) [virtual]`

Sets the autocalibration configuration.

#### Parameters

<i>channel</i>	The channel number.
<i>disable</i>	true if autocalibration is to be disabled.

**11.109.3.49 SetBlankingEnable() [1/4]** `virtual void SetBlankingEnable (`  
`uint32_t electrode,`  
`array< bool >^ enable ) [virtual]`

Defines whether an electrode should be blanked while stimulation is in progress.

#### Parameters

<i>electrode</i>	The electrode number.
<i>enable</i>	True if the switch is to be opened, false if it is to remain closed while stimulation is in progress.

**11.109.3.50 SetBlankingEnable() [2/4]** `virtual void SetBlankingEnable (`  
`uint32_t electrode,`  
`bool enable ) [virtual]`

Defines whether an electrode should be blanked while stimulation is in progress.

#### Parameters

<i>electrode</i>	The electrode number.
<i>enable</i>	True if the switch is to be opened, false if it is to remain closed while stimulation is in progress.

**11.109.3.51 SetBlankingEnable()** [3/4] `virtual void SetBlankingEnable (`  
`uint32_t Scu_HS,`  
`uint32_t electrode,`  
`array< bool >^ enable ) [virtual]`

Defines whether an electrode should be blanked while stimulation is in progress.

#### Parameters

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

#### Parameters

<i>electrode</i>	The electrode number.
<i>enable</i>	True if the switch is to be opened, false if it is to remain closed while stimulation is in progress.

**11.109.3.52 SetBlankingEnable()** [4/4] `virtual void SetBlankingEnable (`  
`uint32_t Scu_HS,`  
`uint32_t electrode,`  
`bool enable ) [virtual]`

Defines whether an electrode should be blanked while stimulation is in progress.

#### Parameters

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

#### Parameters

<i>electrode</i>	The electrode number.
<i>enable</i>	True if the switch is to be opened, false if it is to remain closed while stimulation is in progress.

**11.109.3.53 SetCurrentMode()** [1/2] `virtual void SetCurrentMode ( ) [virtual]`

Sets all channels to current mode (STG3008-FA and STG400x only).

**11.109.3.54 SetCurrentMode()** [2/2] `virtual void SetCurrentMode (`  
`unsigned int channel ) [virtual]`

Sets a channel to current mode (STG3008-FA and STG400x only).

**Parameters**

<i>channel</i>	The channel to change.
----------------	------------------------

**11.109.3.55 SetCurrentRangeByIndex()** `virtual void SetCurrentRangeByIndex (`  
`uint32_t channel,`  
`uint32_t rangeIndex ) [virtual]`

Sets the range index for the current output (STG5 only).

**Parameters**

<i>channel</i>	The channel to change.
<i>rangeIndex</i>	The new range index.

**11.109.3.56 SetDacAmplificationFactor()** `virtual void SetDacAmplificationFactor (`  
`uint32_t DacNumber,`  
`double Factor ) [virtual]`

Set the amplification factor for a DAC.

**Parameters**

<i>DacNumber</i>	The number of the DAC.
<i>Factor</i>	the amplification factor for that DAC, range is from -1.99999 to +1.99999.

**11.109.3.57 SetDigoutMode()** `virtual void SetDigoutMode (`  
`Stg200xDigoutModeEnumNet digoutMode ) [virtual]`

Sets the operation mode of the digital output port, can be Monitor, Manual or SyncOut

**Parameters**

<i>digoutMode</i>	The new operation mode.
-------------------	-------------------------

**11.109.3.58 SetDigoutValue()** `virtual void SetDigoutValue ( uint32_t digoutValue ) [virtual]`

Sets the Value on the digital output port when in manual mode.

#### Parameters

<i>digoutValue</i>	The new value on the digital outputs.
--------------------	---------------------------------------

**11.109.3.59 SetElectrodeDacMux()** [1/4] `virtual void SetElectrodeDacMux ( uint32_t electrode, uint32_t listmodeIndex, array< ElectrodeDacMuxEnumNet >^ dacMux ) [virtual]`

Defines the DAC to use for an electrode.

#### Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

#### Parameters

<i>listmodeIndex</i>	The index for listmode.
<i>dacMux</i>	The DAC to use, can be <a href="#">ElectrodeDacMuxEnumNet.Stg1</a> (1), <a href="#">ElectrodeDacMuxEnumNet.Stg2</a> (2) or <a href="#">ElectrodeDacMuxEnumNet.Stg3</a> (3). To ground an electrode, use <a href="#">ElectrodeDacMuxEnumNet.Ground</a> (0).

**11.109.3.60 SetElectrodeDacMux()** [2/4] `virtual void SetElectrodeDacMux ( uint32_t electrode, uint32_t listmodeIndex, ElectrodeDacMuxEnumNet dacMux ) [virtual]`

Defines the DAC to use for an electrode.

#### Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

## Parameters

<i>listmodeIndex</i>	The index for listmode.
<i>dacMux</i>	The DAC to use, can be <a href="#">ElectrodeDacMuxEnumNet.Stg1</a> (1), <a href="#">ElectrodeDacMuxEnumNet.Stg2</a> (2) or <a href="#">ElectrodeDacMuxEnumNet.Stg3</a> (3). To ground an electrode, use <a href="#">ElectrodeDacMuxEnumNet.Ground</a> (0).

**11.109.3.61 SetElectrodeDacMux()** [3/4] `virtual void SetElectrodeDacMux (`  
`uint32_t Scu_HS,`  
`uint32_t electrode,`  
`uint32_t listmodeIndex,`  
`array< ElectrodeDacMuxEnumNet >^ dacMux ) [virtual]`

Defines the DAC to use for an electrode.

## Parameters

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

## Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

## Parameters

<i>listmodeIndex</i>	The index for listmode.
<i>dacMux</i>	The DAC to use, can be <a href="#">ElectrodeDacMuxEnumNet.Stg1</a> (1), <a href="#">ElectrodeDacMuxEnumNet.Stg2</a> (2) or <a href="#">ElectrodeDacMuxEnumNet.Stg3</a> (3). To ground an electrode, use <a href="#">ElectrodeDacMuxEnumNet.Ground</a> (0).

**11.109.3.62 SetElectrodeDacMux()** [4/4] `virtual void SetElectrodeDacMux (`  
`uint32_t Scu_HS,`  
`uint32_t electrode,`  
`uint32_t listmodeIndex,`  
`ElectrodeDacMuxEnumNet dacMux ) [virtual]`

Defines the DAC to use for an electrode.

## Parameters

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

## Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

## Parameters

<i>listmodeIndex</i>	The index for listmode.
<i>dacMux</i>	The DAC to use, can be <a href="#">ElectrodeDacMuxEnumNet.Stg1</a> (1), <a href="#">ElectrodeDacMuxEnumNet.Stg2</a> (2) or <a href="#">ElectrodeDacMuxEnumNet.Stg3</a> (3). To ground an electrode, use <a href="#">ElectrodeDacMuxEnumNet.Ground</a> (0).

**11.109.3.63 SetElectrodeEnable()** [1/4] `virtual void SetElectrodeEnable (`  
`uint32_t electrode,`  
`uint32_t listmodeIndex,`  
`array< bool >^ enable ) [virtual]`

Enables or disables the stimulation switch for an electrode.

## Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

## Parameters

<i>listmodeIndex</i>	The index for listmode.
<i>enable</i>	1 to enable the electrode, 0 to disable.

**11.109.3.64 SetElectrodeEnable()** [2/4] `virtual void SetElectrodeEnable (`  
`uint32_t electrode,`  
`uint32_t listmodeIndex,`  
`bool enable ) [virtual]`

Enables or disables the stimulation switch for an electrode.

Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

Parameters

<i>listmodeIndex</i>	The index for listmode.
<i>enable</i>	1 to enable the electrode, 0 to disable.

**11.109.3.65 SetElectrodeEnable() [3/4]** `virtual void SetElectrodeEnable (`  
    `uint32_t Scu_HS,`  
    `uint32_t electrode,`  
    `uint32_t listmodeIndex,`  
    `array< bool >^ enable ) [virtual]`

Enables or disables the stimulation switch for an electrode.

Parameters

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

Parameters

<i>listmodeIndex</i>	The index for listmode.
<i>enable</i>	1 to enable the electrode, 0 to disable.

**11.109.3.66 SetElectrodeEnable() [4/4]** `virtual void SetElectrodeEnable (`  
    `uint32_t Scu_HS,`  
    `uint32_t electrode,`

```
uint32_t listmodeIndex,
bool enable ) [virtual]
```

Enables or disables the stimulation switch for an electrode.

#### Parameters

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

#### Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

#### Parameters

<i>listmodeIndex</i>	The index for listmode.
<i>enable</i>	1 to enable the electrode, 0 to disable.

**11.109.3.67 SetElectrodeMode()** [1/4] virtual void SetElectrodeMode (
  
uint32\_t electrode,
  
array< ElectrodeModeEnumNet >^ mode ) [virtual]

Puts an electrode in either automatic or manual mode.

#### Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

#### Returns

0 for automatic and 3 for manual mode.

**11.109.3.68 SetElectrodeMode()** [2/4] virtual void SetElectrodeMode (
  
uint32\_t electrode,
  
ElectrodeModeEnumNet mode ) [virtual]

Puts an electrode in either automatic or manual mode.

**Parameters**

<i>electrode</i>	The electrode number.
------------------	-----------------------

**Parameters**

<i>mode</i>	0 for automatic and 3 for manual mode.
-------------	--

**11.109.3.69 SetElectrodeMode()** [3/4] virtual void SetElectrodeMode (   
     uint32\_t *Scu\_HS*,   
     uint32\_t *electrode*,   
     array< [ElectrodeModeEnumNet](#) >^ *mode* ) [virtual]

Puts an electrode in either automatic or manual mode.

**Parameters**

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

**Parameters**

<i>electrode</i>	The electrode number.
------------------	-----------------------

**Returns**

0 for automatic and 3 for manual mode.

**11.109.3.70 SetElectrodeMode()** [4/4] virtual void SetElectrodeMode (   
     uint32\_t *Scu\_HS*,   
     uint32\_t *electrode*,   
     [ElectrodeModeEnumNet](#) *mode* ) [virtual]

Puts an electrode in either automatic or manual mode.

## Parameters

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

## Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

## Parameters

<i>mode</i>	0 for automatic and 3 for manual mode.
-------------	--

**11.109.3.71 SetEnableAmplifierProtectionSwitch()** [1/4] virtual void SetEnableAmplifierProtectionSwitch (   
     uint32\_t *electrode*,  
     array< bool >^ *enable* ) [virtual]

Defines whether the Amplifier Protection Switch is openend while stimulation is in progress.

## Parameters

<i>electrode</i>	The electrode number.
<i>enable</i>	True if the switch is to be opened, false if it is to remain closed while stimulation is in progress.

**11.109.3.72 SetEnableAmplifierProtectionSwitch()** [2/4] virtual void SetEnableAmplifierProtectionSwitch (   
     uint32\_t *electrode*,  
     bool *enable* ) [virtual]

Defines whether the Amplifier Protection Switch is openend while stimulation is in progress.

## Parameters

<i>electrode</i>	The electrode number.
<i>enable</i>	True if the switch is to be opened, false if it is to remain closed while stimulation is in progress.

**11.109.3.73 SetEnableAmplifierProtectionSwitch() [3/4]** virtual void SetEnableAmplifierProtectionSwitch (

```

    uint32_t Scu_HS,
    uint32_t electrode,
    array< bool >^ enable ) [virtual]

```

Defines whether the Amplifier Protection Switch is openend while stimulation is in progress.

#### Parameters

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

#### Parameters

<i>electrode</i>	The electrode number.
<i>enable</i>	True if the switch is to be opened, false if it is to remain closed while stimulation is in progress.

**11.109.3.74 SetEnableAmplifierProtectionSwitch() [4/4]** virtual void SetEnableAmplifierProtectionSwitch (

```

    uint32_t Scu_HS,
    uint32_t electrode,
    bool enable ) [virtual]

```

Defines whether the Amplifier Protection Switch is openend while stimulation is in progress.

#### Parameters

<i>Scu_HS</i>	The SCU headstage number.
---------------	---------------------------

#### Parameters

<i>electrode</i>	The electrode number.
<i>enable</i>	True if the switch is to be opened, false if it is to remain closed while stimulation is in progress.

**11.109.3.75 SetExternalElectrodeEnable() [1/2]** virtual void SetExternalElectrodeEnable (

```

    uint32_t electrode,
    uint32_t listmodeIndex,
    array< bool >^ enable ) [virtual]

```

Enables or disables the stimulation switch for an external electrode.

## Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

## Parameters

<i>listmodeIndex</i>	The index for listmode.
<i>enable</i>	1 to enable the electrode, 0 to disable.

**11.109.3.76 SetExternalElectrodeEnable()** [2/2] virtual void SetExternalElectrodeEnable (   
    uint32\_t *electrode*,  
    uint32\_t *listmodeIndex*,  
    bool *enable* ) [virtual]

Enables or disables the stimulation switch for an external electrode.

## Parameters

<i>electrode</i>	The electrode number.
------------------	-----------------------

## Parameters

<i>listmodeIndex</i>	The index for listmode.
<i>enable</i>	1 to enable the electrode, 0 to disable.

**11.109.3.77 SetFAAmplification()** virtual void SetFAAmplification (   
    unsigned int *amplification* ) [virtual]

**11.109.3.78 SetHeadstage()** virtual void SetHeadstage (   
    unsigned int *headstage* ) [virtual]

**11.109.3.79 SetListmodeIndexRange()** virtual void SetListmodeIndexRange (   
     unsigned int *electrodeGroup*,   
     unsigned int *startIndex*,   
     unsigned int *endIndex*,   
     unsigned int *mode* ) [virtual]

Define the range of list mode indexes to use for the given electrode group.

#### Parameters

<i>electrodeGroup</i>	The electrodegroup for which the range is defined.
-----------------------	--

#### Parameters

<i>startIndex</i>	The index of the first active element in the listmode list.
<i>endIndex</i>	The index of the last active element in the listmode list.
<i>mode</i>	0 for "start with startIndex", 1 for "start with endIndex".

**11.109.3.80 SetListmodeTriggerSource()** [1/2] virtual void SetListmodeTriggerSource (   
     unsigned int *electrodeGroup*,   
     TriggerSourceEnumNet *triggersource* ) [virtual]

Define the signal which triggers the transition from one list mode entry to the next. After reaching the last entry in the list, the first entry is selected. For triggersource use the Enum which corresponds to the device in use, for example use *SCUDigitalSourceEnumNet* and cast to *TriggerSourceEnumNet* if working with an SCU device.

#### Parameters

<i>electrodeGroup</i>	The electrodegroup for which the triggersource is defined.
-----------------------	--

#### Parameters

<i>triggersource</i>	One of the possible sources for the transition.
----------------------	---

**11.109.3.81 SetListmodeTriggerSource()** [2/2] virtual void SetListmodeTriggerSource (   
     unsigned int *electrodeGroup*,   
     TriggerSourceEnumNet *triggersource*,   
     int *bitnumOffset* ) [virtual]

Define the signal which triggers the transition from one list mode entry to the next. After reaching the last entry in the list, the first entry is selected. For triggersource use the Enum which corresponds to the device in use, for example use *SCUDigitalSourceEnumNet* and cast to *TriggerSourceEnumNet* if working with an SCU device.

## Parameters

<i>electrodeGroup</i>	The electrodegroup for which the triggersource is defined.
-----------------------	--

## Parameters

<i>triggersource</i>	One of the possible sources for the transition.
<i>bitnumOffset</i>	Number to add to the numeric value of the <i>triggersource</i> enum.

**11.109.3.82 SetMeasurementMode()** `virtual void SetMeasurementMode ( unsigned int channel ) [virtual]`

Sets a channel to measurement mode (STG3008-FA).

## Parameters

<i>channel</i>	The channel to change.
----------------	------------------------

**11.109.3.83 SetOutputRate()** `void SetOutputRate ( uint32_t rate )`

Change the output rate of the STG. Valid rates are from 1000 Hz to 50000 Hz.

## Parameters

<i>rate</i>	The new output rate in Hz.
-------------	----------------------------

**11.109.3.84 SetStgProgramInfo()** `void SetStgProgramInfo ( DateTime timestamp, String^ filename, Guid guid )`

Store Download information in the STG. This function can be used to store the filename and timestamp of the last download for later query.

## Parameters

<i>timestamp</i>	The timestamp of last download.
<i>filename</i>	The filename of the downlaoded waveform.

**11.109.3.85 SetSyncoutMap()** `virtual void SetSyncoutMap (`  
    `uint32_t channel,`  
    `uint32_t syncoutMap ) [virtual]`

Sets the mapping between external syncout outputs and internal syncout channels.

**Parameters**

<i>channel</i>	The external syncout output channel number (zero based).
<i>syncoutMap</i>	A bitmap of internal syncout channels to map to channel.

**11.109.3.86 SetTriggerSource()** [1/3] `virtual void SetTriggerSource (`  
    `unsigned int triggernum,`  
    `DigitalSource< digitalsourceenum >^ triggersource,`  
    `int bitnum_offset ) [virtual]`

**11.109.3.87 SetTriggerSource()** [2/3] `virtual void SetTriggerSource (`  
    `unsigned int triggernum,`  
    `TriggerSourceEnumNet triggersource ) [virtual]`

**11.109.3.88 SetTriggerSource()** [3/3] `virtual void SetTriggerSource (`  
    `unsigned int triggernum,`  
    `TriggerSourceEnumNet triggersource,`  
    `int bitnum_offset ) [virtual]`

**11.109.3.89 SetVoltageMode()** [1/2] `virtual void SetVoltageMode ( ) [virtual]`

Sets all channels to voltage mode (STG3008-FA and STG400x only).

**11.109.3.90 SetVoltageMode()** [2/2] `virtual void SetVoltageMode (`  
    `unsigned int channel ) [virtual]`

Sets a channel to voltage mode (STG3008-FA and STG400x only).

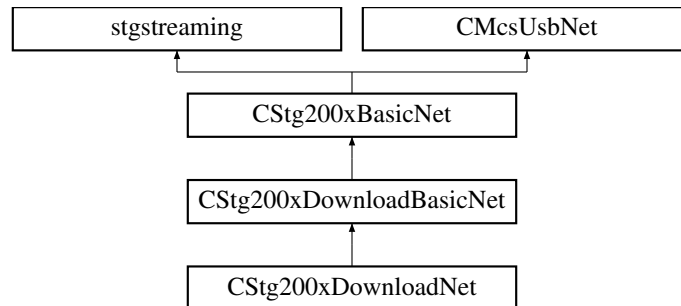

**Parameters**

<i>channel</i>	The channel to change.
----------------	------------------------

## Additional Inherited Members

### 11.110.1 Detailed Description

[CStg200xDownloadBasicNet](#) is the base class to control the download mode of the MCS STG device.

### 11.110.2 Member Function Documentation

**11.110.2.1 ClearChannelData()** virtual void ClearChannelData (   
uint32\_t channel ) [virtual]

Delete a stimulus pattern for a channel from STG memory

#### Parameters

<i>channel</i>	Specifies the channel to clear.
----------------	---------------------------------

**11.110.2.2 ClearSyncData()** `virtual void ClearSyncData (   
 uint32_t channel ) [virtual]`

Delete a SyncOut pattern for a channel from STG memory.

**Parameters**

<i>channel</i>	Specifies the syncout channel to clear.
----------------	---

**11.110.2.3 DisableAutoReset()** `virtual void DisableAutoReset ( ) [virtual]`

Disable AutoReset of the STG Status.

If autoreset is disabled, the STG status switches to FINISHED after the defined number of sweeps is finished. To switch back to the IDLE status, use CStg200xDownload::ResetStatus()

**11.110.2.4 EnableAutoReset()** `virtual void EnableAutoReset ( ) [virtual]`

Enable AutoReset of the STG Status.

This is the default on power up. If autoreset is enabled, the STG status switches to FINISHED only for one poll cycle after this, it switches to IDLE automatically.

**11.110.2.5 ForceStatusEvent()** `void ForceStatusEvent ( )`

Force a status event.

Force the DLL to create a PollMessage event and to call the pPollCallback function, even if no new status information is available.

**11.110.2.6 GetMemoryUsageDAC()** `uint32_t GetMemoryUsageDAC (   
 uint32_t Channel )`

Queries the memory usage of the current segment and selected analog DAC channel.

The currently used memory is reported for the requested channel.

**Parameters**

<i>Channel</i>	channel for the amount of interested usage.
----------------	---

**Returns**

Returns the usage in STG memory.

**11.110.2.7 GetMemoryUsageSyncout()** `uint32_t GetMemoryUsageSyncout ( uint32_t Channel )`

Queries the memory usage of the current segment and selected syncout channel.

The currently used memory is reported for the requested channel.

#### Parameters

<i>Channel</i>	channel for the amount of interested usage.
----------------	---

#### Returns

Returns the usage in STG memory.

**11.110.2.8 GetSweepCount()** `void GetSweepCount ( [Out] array< uint32_t >^% sweeps, [Out] array< uint32_t >^% triggers )`

Get the sweep and trigger count of the STG.

- The triggercount tells how many times each trigger was active and is reset to zero on download of new channel data.
- The sweepcount tells how many times each trigger was already repeated. This count is set to zero on trigger and counts up to repeat in [CStg200xDownloadBasicNet::SetupTrigger](#).

#### Parameters

<i>sweeps</i>	on return contains the number of sweeps for each trigger.
<i>triggers</i>	on return contains the number of trigger events seen for each trigger.

**11.110.2.9 GetTrigger()** `void GetTrigger ( [Out] array< uint32_t >^% channelmap, [Out] array< uint32_t >^% syncoutmap, [Out] array< uint32_t >^% repeat )`

Queries the trigger settings for the STG. Note that all memory segments have their own trigger setting.

#### Parameters

<i>channelmap</i>	For each trigger, a bitmap of channels that belong to this trigger.
-------------------	---

## Parameters

<i>syncoutmap</i>	For each trigger, a bitmap of syncouts that belong to this trigger.
<i>repeat</i>	For each trigger, define the number of times this trigger should be repeated.

**11.110.2.10 ResetStatus()** `void ResetStatus (`  
     `uint32_t triggermap )`

Reset the status flag.

## Parameters

<i>triggermap</i>	bitmap of trigger for which to reset the status.
-------------------	--

**11.110.2.11 SendChannelData()** `virtual void SendChannelData (`  
     `uint32_t channel,`  
     `array< uint16_t >^ pData,`  
     `array< uint64_t >^ tData ) [virtual]`

Uploads analog data (stimulus patterns) to the STG.

Sends datapoints to a given channel on the STG. The list of datapoints will be sent to the selected channel. Data previously sent to the channel is overwritten.

Each datapoint is represented by an integer value in the range from 0 to 4095 (bit 0 to 11), its sign is taken from bit 12, 0 is for positive amplitude, and 1 for negative amplitude Bits 13 to 15 have to be zero.

The duration is given as a list of 64 bit integers. Durations are given in units of  $\mu$ s. The STG has a resolution of 20  $\mu$ s.

## Parameters

<i>channel</i>	Specifies the channel to append the data to.
<i>pData</i>	A list of datapoints.
<i>tData</i>	A list of durations as <code>int64_t</code> . The time is given in units of $\mu$ s.

**11.110.2.12 SendSyncData()** `virtual void SendSyncData (`  
     `uint32_t channel,`  
     `array< uint16_t >^ pData,`  
     `array< uint64_t >^ tData ) [virtual]`

Uploads sync output data to the STG.

Sends sync output data to a given channel on the STG. The list of datapoints will be sent to the selected sync output channel. Sync output data previously sent to the channel is overwritten.

Each datapoint is represented by an integer value and can be either 0 or 1.

The duration is given as a list of 64 bit integers. Durations are given in units of  $\mu\text{s}$ . The STG has a resolution of 20  $\mu\text{s}$ . If your application can not handle 64 bit integers, use the STG200x\_SendSyncData32() call instead.

#### Parameters

<i>channel</i>	Specifies the sync output channel to append the data to.
<i>pData</i>	A list of datapoints.
<i>tData</i>	A list of durations as int64_t. The time is given in units of $\mu\text{s}$ .

**11.110.2.13 SetupRetriggerMode() [1/2]** `virtual void SetupRetriggerMode (`  
`int8_t trigger,`  
`RetriggerActionEnumNet same_trigger,`  
`RetriggerActionEnumNet other_trigger ) [virtual]`

Define the action on triggers while the STG is running.

The STG has three options how to handle a successive trigger while a trigger is active.

- stop this trigger (default action)
- restart this trigger
- ignore the signal

#### Parameters

<i>trigger</i>	The trigger to change.
<i>same_trigger</i>	Action for successive triggers in Normal Mode, and for triggers to the currently selected segment in Multi - File Mode.
<i>other_trigger</i>	Action for successive triggers in Multi-File Mode for a trigger on a segment not currently selected. Not used in Normal Mode.

**11.110.2.14 SetupRetriggerMode() [2/2]** `virtual void SetupRetriggerMode (`  
`RetriggerActionEnumNet same_trigger,`  
`RetriggerActionEnumNet other_trigger ) [virtual]`

Define the action on triggers while the STG is running.

The STG has three options how to handle a successive trigger while a trigger is active.

- stop this trigger (default action)
- restart this trigger
- ignore the signal

## Parameters

<i>same_trigger</i>	Action for successive triggers in Normal Mode, and for triggers to the currently selected segment in Multi - File Mode.
<i>other_trigger</i>	Action for successive triggers in Multi-File Mode for a trigger on a segment not currently selected. Not used in Normal Mode.

**11.110.2.15 SetupTrigger()** `virtual void SetupTrigger (`  
     `uint32_t first_trigger,`  
     `array< uint32_t >^ channelmap,`  
     `array< uint32_t >^ syncoutmap,`  
     `array< uint32_t >^ repeat ) [virtual]`

Configures the trigger settings for the STG. Note that all memory segments have their own trigger setting.

## Parameters

<i>first_trigger</i>	The number of the first trigger to change.
----------------------	--

## Parameters

<i>channelmap</i>	For each trigger, a bitmap of channels that belong to this trigger.
-------------------	---

## Parameters

<i>syncoutmap</i>	For each trigger, a bitmap of syncouts that belong to this trigger.
<i>repeat</i>	For each trigger, define the number of times this trigger should be repeated.

**11.110.2.16 SetupTriggerSingle()** `virtual void SetupTriggerSingle (`  
     `uint32_t trigger,`  
     `uint32_t channelmap,`  
     `uint32_t syncoutmap,`  
     `uint32_t repeat ) [virtual]`

Configures the trigger settings for the STG. Note that all memory segments have their own trigger setting.

## Parameters

<i>trigger</i>	The trigger to change.
----------------	------------------------

**Parameters**

<i>channelmap</i>	A bitmap of channels that belong to this trigger.
-------------------	---

**Parameters**

<i>syncoutmap</i>	A bitmap of syncouts that belong to this trigger.
<i>repeat</i>	The number of times this trigger should be repeated.

### 11.111.1 Detailed Description

Main class for the STG download mode This class implements the STG download mode interface.

### 11.111.2 Constructor & Destructor Documentation

#### 11.111.2.1 CStg200xDownloadNet() [1/2] [CStg200xDownloadNet](#) ( )

Use this constructor if you do not want to use the status callback.

**11.111.2.2 CStg200xDownloadNet()** [2/2] `CStg200xDownloadNet ( OnStgPollStatus^ pollStatus )`

Use this constructor if you want to use the status callback.

**11.111.2.3 ~CStg200xDownloadNet()** `~CStg200xDownloadNet ( )`

### 11.111.3 Member Function Documentation

**11.111.3.1 ClearChannel\_PrepareAndSendData()** `void ClearChannel_PrepareAndSendData ( uint32_t channel, array< int32_t >^ amplitude, array< uint64_t >^ duration, STG_DestinationEnumNet destType, bool doClear )`

Prepare and append data to a given channel on the STG.

Each datapoint is represented by an signed 32bit integer value. When using voltage stimulation, the values are in multiple of 1  $\mu$ V, thus the possible range is  $\pm 2000$  V. When using current stimulation, the values are in multiple of 1 nA, this the possible range is  $\pm 2000$  mA.

The duration is given as a list of 64 bit integers. Durations are given in units of  $\mu$ s. The STG has a resolution of 20  $\mu$ s.

Blocks of data which should repeat can be defined by prepending such a block with an entry in the arrays where both amplitude and duration is zero. The end of such an block is marked by an entry where the duration is set to zero and the amplitude beeing set to the number of times the block should run. Blocks can be nested.

#### Parameters

<i>channel</i>	The channel number to send data to.
----------------	-------------------------------------

#### Parameters

<i>amplitude</i>	A list of amplitudes in units of $\mu$ V and nA in voltage and current mode, respectively.
------------------	--

#### Parameters

<i>duration</i>	A list of durations in units of $\mu$ s.
<i>destType</i>	specifies wheather the data is for syncout, current or voltage stimulation.

**11.111.3.2 DisableMultiFileMode()** `void DisableMultiFileMode ( )`

Disable the Multi-File mode of the STG

Switch the STG back to normal mode. In this mode, trigger inputs are assigned to channels, not to segments.

**11.111.3.3 EnableMultiFileMode()** `void EnableMultiFileMode (   
uint32_t submode )`

Enable the Multi-File mode of the STG.

In Multi-File mode, the trigger inputs switch between segments. To use this mode, define up to as many segments as trigger inputs are available and fill each segment with a stimulus pattern.

Now a trigger on trigger input 1 switches the STG to the first segment and starts all triggers in this segment. Likewise, a trigger on trigger input 2, 3 and 4 selects the respective segment and start all triggers in this segment. So the Multi-File Mode can be used to predefine up to four different stimuli which can be selected without the need for a computer connection.

**Parameters**

<i>submode</i>	The submode. Submode 0 is regular Multi-File mode as described above, submode 1 is extended Multi-File mode, where the segment is selected based on the digital pattern on the digital inputs. In this mode, 256 different segments can be defined and used.
----------------	--

**11.111.3.4 GetModuleCurrent()** `uint32_t GetModuleCurrent (   
unsigned int channel )`**11.111.3.5 GetModuleTemp()** `int32_t GetModuleTemp (   
unsigned int channel )`**11.111.3.6 PrepareAndAppendData()** `void PrepareAndAppendData (   
uint32_t channel,   
array< int32_t >^ amplitude,   
array< uint64_t >^ duration,   
STG_DestinationEnumNet destType )`

Prepare and append data to a given channel on the STG.

Each datapoint is represented by an signed 32bit integer value. When using voltage stimulation, the values are in multiple of 1  $\mu$ V, thus the possible range is  $\pm 2000$  V. When using current stimulation, the values are in multiple of 1 nA, this the possible range is  $\pm 2000$  mA.

The duration is given as a list of 64 bit integers. Durations are given in units of  $\mu$ s. The STG has a resolution of 20  $\mu$ s.

Blocks of data which should repeat can be defined by prepending such a block with an entry in the arrays where both amplitude and duration is zero. The end of such an block is marked by an entry where the duration is set to zero and the amplitude beeing set to the number of times the block should run. Blocks can be nested.

#### Parameters

<i>channel</i>	The channel number to send data to.
----------------	-------------------------------------

#### Parameters

<i>amplitude</i>	A list of amplitudes in units of $\mu$ V and nA in voltage and current mode, respectively.
------------------	--

#### Parameters

<i>duration</i>	A list of durations in units of $\mu$ s.
<i>destType</i>	specifies wheather the data is for syncout, current or voltage stimulation.

**11.111.3.7 PrepareAndSendData()** `void PrepareAndSendData (`  
     `uint32_t channel,`  
     `array< int32_t >^ amplitude,`  
     `array< uint64_t >^ duration,`  
     `STG_DestinationEnumNet destType )`

Prepare and send data to a given channel on the STG. Previous data sent to that channel is erased first.

Each datapoint is represented by an signed 32bit integer value. When using voltage stimulation, the values are in multiple of 1  $\mu$ V, thus the possible range is  $\pm 2000$  V. When using current stimulation, the values are in multiple of 1 nA, this the possible range is  $\pm 2000$  mA.

The duration is given as a list of 64 bit integers. Durations are given in units of  $\mu$ s. The STG has a resolution of 20  $\mu$ s.

Blocks of data which should repeat can be defined by prepending such a block with an entry in the arrays where both amplitude and duration is zero. The end of such an block is marked by an entry where the duration is set to zero and the amplitude beeing set to the number of times the block should run. Blocks can be nested.

## Parameters

<i>channel</i>	The channel number to send data to.
----------------	-------------------------------------

## Parameters

<i>amplitude</i>	A list of amplitudes in units of $\mu\text{V}$ and $\text{nA}$ in voltage and current mode, respectively.
------------------	---

## Parameters

<i>duration</i>	A list of durations in units of $\mu\text{s}$ .
<i>destType</i>	specifies wheather the data is for syncout, current or voltage stimulation.

### 11.111.3.8 QueryTriggerstatus() `StgStatusNet ^ QueryTriggerstatus ( )`

### 11.111.3.9 SendSegmentDefine() `void SendSegmentDefine ( array< uint32_t >^ segment_list )`

Defines the segment memory layout of the STG.

On reset, the STG has one segment containing all available memory.

With this command, the STG memory can be devided into several segments. Each segment can be filled with stimulus data.

## Parameters

<i>segment_list</i>	The List of memory sizes (one per segment).
---------------------	---

### 11.111.3.10 SendSegmentSelect() `void SendSegmentSelect ( uint32_t segment, Stg200xSegmentFlagsEnumNet segmentflags )`

Switchs segment.

**Parameters**

<i>segment</i>	The number of the segment to select.
----------------	--------------------------------------

**Parameters**

<i>segmentflags</i>	A bitmap of flags, bit 1: assign all channels to the trigger number equal to the segment.
---------------------	---

**11.111.3.11 SendSegmentStart()** `void SendSegmentStart (`  
    `uint32_t triggermap,`  
    `uint32_t segment,`  
    `Stg200xSegmentFlagsEnumNet segmentflags )`

Switchs segment and starts trigger.

**Parameters**

<i>triggermap</i>	A bitmap of triggers that will be started.
-------------------	--

**Parameters**

<i>segment</i>	The number of the segment to select.
----------------	--------------------------------------

**Parameters**

<i>segmentflags</i>	A bitmap of flags, bit 1: assign all channels to the trigger number equal to the segment.
---------------------	---

**11.111.3.12 SetOutputMap()** `void SetOutputMap (`  
    `array< uint32_t >^ ChannelLayout )`

**11.111.4 Event Documentation**

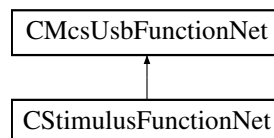

**11.111.4.1 MwPollStatusEvent** [OnMwPollStatus](#)<sup>^</sup> MwPollStatusEvent [add], [remove], [raise]

**11.111.4.2 Stg200xPollStatusEvent** [OnStgPollStatus](#)<sup>^</sup> Stg200xPollStatusEvent [add], [remove], [raise]

### 11.112.1 Constructor & Destructor Documentation

**11.112.1.1 CStimulusFunctionNet()** [1/2] `CStimulusFunctionNet (`  
`CMcsUsbNet^ mcsusb,`  
`CMcsUsbFunctionPointerContainer^ stimulusFunctionPointerContainer )`

**11.112.1.2 CStimulusFunctionNet()** [2/2] `CStimulusFunctionNet (`  
`CMcsUsbNet^ mcsusb )`

## 11.112.2 Member Function Documentation

**11.112.2.1 ClearChannel\_PrepareAndSendData()** `void ClearChannel_PrepareAndSendData (`  
`uint32_t channel,`  
`array< int32_t >^ amplitude,`  
`array< uint64_t >^ duration,`  
`STG_DestinationEnumNet destType,`  
`bool doClear )`

**11.112.2.2 ClearChannelData()** `void ClearChannelData (`  
`int channel )`

Delete a Stimulus Pattern from STG memory

### Parameters

<i>channel</i>	specifies the channel to clear.
----------------	---------------------------------

**11.112.2.3 ClearMultiplexedData()** `void ClearMultiplexedData ( )`

Clears the Stimulation Memory in the STG device.

**11.112.2.4 ClearSyncData()** `void ClearSyncData (`  
`int channel )`

Delete a Syncout Pattern from STG memory

### Parameters

<i>channel</i>	specifies the channel to clear.
----------------	---------------------------------

```

11.112.2.5 CreateSideband() SidebandData ^ CreateSideband (
    array< int32_t >^ StimulusActive,
    array< int32_t >^ Syncout,
    array< uint64_t >^ Duration,
    uint32_t Bit0Time,
    uint32_t Bit3Time,
    uint32_t Bit4Time )

```

Creates the Sideband Channel for the MEA2100 device.

Each datapoint is represented by an signed 32bit integer value. A value 0 means that the stimulation is active during that time. A value 1 means that the stimulation is not active during that time.

The duration is given as a list of 64 bit integers. Durations are given in units of  $\mu\text{s}$ . The STG has a resolution of 20  $\mu\text{s}$ .

#### Parameters

<i>StimulusActive</i>	A list of datapoints which define weather the Stimulus is active or idle at that time as int32.
-----------------------	---

#### Parameters

<i>Duration</i>	A list of durations as uint64. The time is given in units of $\mu\text{s}$ .
<i>Bit0Time</i>	Time in $\mu\text{s}$ for which Bit 0 (Blanking) is to be extended.

#### Parameters

<i>Bit3Time</i>	Time in $\mu\text{s}$ for which Bit 3 (Stimulus Enable) is to be extended.
-----------------	--

#### Parameters

<i>Bit4Time</i>	Time in $\mu\text{s}$ for which Bit 4 (Stimulus Selector) is to be extended.
-----------------	--

#### Returns

Error Status. 0 on success.

**11.112.2.6 ForceStatusEvent()** `void ForceStatusEvent ( )`

Force a status event. Force the DLL to create a PollMessage event and to call the pPollCallback function, even if no new status information is available.

**11.112.2.7 GetAvailableMemory()** `uint32_t GetAvailableMemory ( )`

Get the amount of memory available in the currently selected segment of the STG.

**Returns**

The total memory available on the STG in bytes.

**11.112.2.8 GetCurrentRangeInNanoAmp()** `int GetCurrentRangeInNanoAmp (   
uint32_t channel )`

Gets the Current Range of the specified channel in Nanoamps.

**Parameters**

<i>channel</i>	Channel which is queried.
----------------	---------------------------

**Returns**

The Current Range of the specified channel in Nanoamps.

**11.112.2.9 GetCurrentResolutionInNanoAmp()** `int GetCurrentResolutionInNanoAmp (   
uint32_t channel )`

Gets the Current Resolution of the specified channel in Nanoamps.

**Parameters**

<i>channel</i>	Channel which is queried.
----------------	---------------------------

**Returns**

The Current Resolution of the specified channel in Nanoamps.

**11.112.2.10 GetDACResolution()** `int GetDACResolution ( )`

Gets number of bits of the DAC resolution.

**Returns**

The DAC resolution in bits.

**11.112.2.11 GetMultiplexedDataChannelsInBlock()** `int GetMultiplexedDataChannelsInBlock ( )`

Gets the number of stimulus data channels to send per time slice. Might be greater than the number of configured channels. Fill unused channels with dummy data in `SendMultiplexedData`

**11.112.2.12 GetNumberOfAnalogChannels()** `int GetNumberOfAnalogChannels ( )`

Get the number of STG channels.

**Returns**

The number of STG channels.

**11.112.2.13 GetTotalMemory()** `uint32_t GetTotalMemory ( )`

Get the total amount of memory available on the STG (all segments).

**Returns**

The total memory available on the STG in bytes.

**11.112.2.14 GetVoltageRangeInMicroVolt()** `int GetVoltageRangeInMicroVolt (   
uint32_t channel )`

Gets the Voltage Range of the specified channel in Microvolts.

**Parameters**

<i>channel</i>	Channel which is queried.
----------------	---------------------------

**Returns**

The Voltage Range of the specified channel in Microvolts.

**11.112.2.15 GetVoltageResolutionInMicroVolt()** `int GetVoltageResolutionInMicroVolt ( uint32_t channel )`

Gets the Voltage Resolution of the specified channel in Microvolts.

**Parameters**

<i>channel</i>	Channel which is queried.
----------------	---------------------------

**Returns**

The Voltage Resolution of the specified channel in Microvolts.

**11.112.2.16 PrepareAndAppendData()** `void PrepareAndAppendData ( uint32_t channel, array< int32_t >^ amplitude, array< uint64_t >^ duration, STG_DestinationEnumNet destType )`

Prepare and append data to a given channel on the STG.

Each datapoint is represented by an signed 32bit integer value. When using voltage stimulation, the values are in multiple of 1  $\mu$ V, thus the possible range is  $\pm 2000$  V. When using current stimulation, the values are in multiple of 1 nA, this the possible range is  $\pm 2000$  mA.

The duration is given as a list of 64 bit integers. Durations are given in units of  $\mu$ s. The STG has a resolution of 20  $\mu$ s.

Blocks of data which should repeat can be defined by prepending such a block with an entry in the arrays where both amplitude and duration is zero. The end of such an block is marked by an entry where the duration is set to zero and the amplitude beeing set to the number of times the block should run. Blocks can be nested.

**Parameters**

<i>channel</i>	The channel number to send data to.
----------------	-------------------------------------

**Parameters**

<i>amplitude</i>	A list of amplitudes in units of $\mu$ V and nA in voltage and current mode, respectively.
------------------	--

**Parameters**

<i>duration</i>	A list of durations in units of $\mu\text{s}$ .
<i>destType</i>	specifies wheather the data is for syncout, current or voltage stimulation.

**Returns**

Error Status. 0 on success.

**11.112.2.17 PrepareAndSendData()** `void PrepareAndSendData (`  
    `uint32_t channel,`  
    `array< int32_t >^ amplitude,`  
    `array< uint64_t >^ duration,`  
    `STG_DestinationEnumNet destType )`

Prepare and send data to a given channel on the STG. Previous data sent to that channel is erased first.

Each datapoint is represented by an signed 32bit integer value. When using voltage stimulation, the values are in multiple of 1  $\mu\text{V}$ , thus the possible range is  $\pm 2000\text{ V}$ . When using current stimulation, the values are in multiple of 1 nA, this the possible range is  $\pm 2000\text{ mA}$ .

The duration is given as a list of 64 bit integers. Durations are given in units of  $\mu\text{s}$ . The STG has a resolution of 20  $\mu\text{s}$ .

Blocks of data which should repeat can be defined by prepending such a block with an entry in the arrays where both amplitude and duration is zero. The end of such an block is marked by an entry where the duration is set to zero and the amplitude beeing set to the number of times the block should run. Blocks can be nested.

**Parameters**

<i>channel</i>	The channel number to send data to.
----------------	-------------------------------------

**Parameters**

<i>amplitude</i>	A list of amplitudes in units of $\mu\text{V}$ and nA in voltage and current mode, respectively.
------------------	--

## Parameters

<i>duration</i>	A list of durations in units of $\mu$ s.
<i>destType</i>	specifies wheather the data is for syncout, current or voltage stimulation.

## Returns

Error Status. 0 on success.

**11.112.2.18 PrepareData()** `StimulusDeviceDataAndUnrolledData ^ PrepareData (`  
`int channel,`  
`array< int32_t >^ amplitude,`  
`array< uint64_t >^ duration,`  
`STG_DestinationEnumNet destType )`

**11.112.2.19 SendMultiplexedData()** `void SendMultiplexedData (`  
`array< uint16_t >^ data )`

Sends stimulus data in multiplexed form. All 16 bits words for the enabled DAC and digital channels are muxed together per time slice.

## Parameters

<i>data</i>	Array of data to be sent.
-------------	---------------------------

**11.112.2.20 SendPreparedData()** `void SendPreparedData (`  
`int channel,`  
`StimulusDeviceDataAndUnrolledData^ device_data_and_unrolled,`  
`STG_DestinationEnumNet destType )`

**11.112.2.21 SendStart()** `void SendStart (`  
`uint32_t triggermap )`

Start (Trigger) the STG. The startup delay is in the range of a few ms.

## Parameters

<i>triggermap</i>	A bitmap of triggers which will be started.
-------------------	---

**11.112.2.22 SendStop() [1/2]** `void SendStop (`  
`uint32_t triggermap )`

Stop some or all triggers of the STG.

## Parameters

<i>triggermap</i>	A bitmap of triggers which will be stopped.
-------------------	---

**11.112.2.23 SendStop() [2/2]** `void SendStop (`  
`uint32_t triggermap,`  
`int options )`

Stop some or all triggers of the STG.

## Parameters

<i>triggermap</i>	A bitmap of triggers which will be stopped.
<i>options</i>	bitmap of options, currently only STOP_OPTION_SAVESTOP (0x80) is defined, which bypasses the stop commands when a syncout associated with a given sync-out has bit 1 (0x02) set. Can be used e.g. to prevent a stop while a biphasic stimulation pulse is active..

**11.112.2.24 SetupTrigger()** `void SetupTrigger (`  
`uint32_t first_trigger,`  
`array< uint32_t >^ channelmap,`  
`array< uint32_t >^ syncoutmap,`  
`array< uint32_t >^ repeat )`

Configures the trigger settings for the STG. Note that all memory segments have their own trigger setting.

## Parameters

<i>first_trigger</i>	The number of the first trigger to change.
----------------------	--

## Parameters

<i>channelmap</i>	For each trigger, a bitmap of channels that belong to this trigger.
-------------------	---

## Parameters

<i>syncoutmap</i>	For each trigger, a bitmap of syncouts that belong to this trigger.
<i>repeat</i>	For each trigger, define the number of times this trigger should be repeated.

**11.112.2.25 SetupTriggerSingle()** `void SetupTriggerSingle (`  
     `uint32_t trigger,`  
     `uint32_t channelmap,`  
     `uint32_t syncoutmap,`  
     `uint32_t repeat )`

Configures the trigger settings for the STG. Note that all memory segments have their own trigger setting.

## Parameters

<i>trigger</i>	The trigger to change.
----------------	------------------------

## Parameters

<i>channelmap</i>	A bitmap of channels that belong to this trigger.
-------------------	---

## Parameters

<i>syncoutmap</i>	A bitmap of syncouts that belong to this trigger.
<i>repeat</i>	The number of times this trigger should be repeated.

**11.112.2.26 StartPoll()** `void StartPoll ( )`

Starts the interrupt fetching thread and delivers events

### 11.112.2.27 StopPoll() `void StopPoll ( )`

Stops the interrupt fetching thread and delivers events

## 11.112.3 Event Documentation

### 11.112.3.1 PollStatusEvent `OnStgPollStatus^ PollStatusEvent`

## 11.113 CSw2to64DeviceNet Class Reference

The class to control the MCS-USB-Sw2to64 device.

#### 11.113.1 Detailed Description

The class to control the MCS-USB-Sw2to64 device.

This class controls the settings of the MCS-USB-Sw2to64. The box has two inputs for signals. Each of the 64 outputs can be connected to one of the input signals, could be held open or connected ground. Valid switch states are 0, 1, 2 or 3 for each of the settings.

### 11.113.2 Constructor & Destructor Documentation

**11.113.2.1 CSw2to64DeviceNet()** `CSw2to64DeviceNet ( )`

**11.113.2.2 ~CSw2to64DeviceNet()** `~CSw2to64DeviceNet ( )`

### 11.113.3 Member Function Documentation

**11.113.3.1 GetChannel()** `unsigned char GetChannel ( unsigned short index )`

Gets one current switch position.

#### Parameters

<i>in</i>	<i>index</i>	number of channel to read the switch position from
-----------	--------------	--

#### Returns

switch position of desired channel

**11.113.3.2 GetChannels()** `array<unsigned char> ^ GetChannels ( )`

Gets the current switch positions as char array.

#### Returns

array of char with the size of the number of channels, each char has the setting of a channel

**11.113.3.3 GetNumber()** `unsigned short GetNumber ( )`

Gets the number of channels that can be switched in this box.

The box can have a different number of channels it can switch. Up to now usually 64 channels are returned

**11.113.3.4 SetChannel()** `void SetChannel ( unsigned short index, unsigned char pattern )`

Sets one switch position.

## Parameters

in	<i>index</i>	number of channel to write the switch position to
in	<i>pattern</i>	switch position of the channel

**11.113.3.5 SetChannels()** `void SetChannels (`  
`array< unsigned char >^ pattern )`

Sets the switch positions from a char array.

## Parameters

in	<i>pattern</i>	array of char with the size of the number of channels, each char has the setting of a channel
----	----------------	---

Gets the D-coefficient of the specified device.

**11.114.3.10 GetDDecp()** `int GetDDecp (`  
`unsigned int device )`

**11.114.3.11 GetDevice()** `int GetDevice (`  
`unsigned int channel )`

**11.114.3.12 GetDeviceType()** `TcxDeviceTypeEnumNet GetDeviceType ( )`

**11.114.3.13 GetDevname()** `String ^ GetDevname (`  
`unsigned int device )`

**11.114.3.14 GetDMax()** `int GetDMax (`  
`unsigned int device )`

**11.114.3.15 GetDMin()** `int GetDMin (`  
`unsigned int device )`

**11.114.3.16 GetDuty()** `int GetDuty (`  
`unsigned int channel )`

Gets the duty cycle of the heating element.

## Parameters

<i>channel</i>	The channel number.
----------------	---------------------

## Returns

The duty cycle in percent, the value of  $320 * 64$  corresponds to 100 %.

**11.114.3.17 GetEnableHeaterLimit()** `bool GetEnableHeaterLimit ( unsigned int device )`

**11.114.3.18 GetEnableThermocouple()** `bool GetEnableThermocouple ( unsigned int device )`

**11.114.3.19 GetHasThermocouple()** `bool GetHasThermocouple ( )`

Gets whether the device supports a thermocouple.

**11.114.3.20 GetHeaterLimit()** `int GetHeaterLimit ( unsigned int device )`

Gets the temperature limit of the specified heater in units of 0.1 °C.

**11.114.3.21 GetHeaterTemp()** `int GetHeaterTemp ( unsigned int channel )`

Gets the temperature of the specified heater in units of 0.1 °C.

**11.114.3.22 GetI()** `int GetI ( unsigned int device )`

Gets the I-coefficient of the specified device.

**11.114.3.23 GetIDecp()** `int GetIDecp (`  
`unsigned int device )`

**11.114.3.24 GetIMax()** `int GetIMax (`  
`unsigned int device )`

**11.114.3.25 GetIMin()** `int GetIMin (`  
`unsigned int device )`

**11.114.3.26 GetIOut()** `int GetIOut (`  
`unsigned int channel )`

Gets the current through the heating element.

#### Parameters

<i>channel</i>	The channel number.
----------------	---------------------

#### Returns

The current in units of mA.

**11.114.3.27 GetMaxHeaterPowerMultiwell()** `double GetMaxHeaterPowerMultiwell ( )`

queries the max. heater power that the Multiwell temperature controller will apply; unit: W; useful range: 5.2W..7.6W

**11.114.3.28 GetMaxP()** `int GetMaxP (`  
`unsigned int device )`

Gets the maximum heater power of the specified device.

**11.114.3.29 GetMaxpDecp()** `int GetMaxpDecp (`  
`unsigned int device )`

**11.114.3.30 GetMaxpMax()** `int GetMaxpMax ( unsigned int device )`

**11.114.3.31 GetMaxpMin()** `int GetMaxpMin ( unsigned int device )`

**11.114.3.32 GetNumControlChannels()** `unsigned int GetNumControlChannels ( )`

Gets the number of channels the device can control/regulate.

**11.114.3.33 GetNumDevices()** `unsigned int GetNumDevices ( )`

**11.114.3.34 GetNumMeasureChannels()** `unsigned int GetNumMeasureChannels ( )`

Gets the number of channels the device can measure.

**11.114.3.35 GetOnOff()** `int GetOnOff ( unsigned int channel )`

Gets if the specified channel is on or off.

**11.114.3.36 GetP()** `int GetP ( unsigned int device )`

Gets the P-coefficient of the specified device.

**11.114.3.37 GetPDecp()** `int GetPDecp ( unsigned int device )`

**11.114.3.38 GetPMax()** `int GetPMax ( unsigned int device )`

**11.114.3.39 GetPMin()** `int GetPMin ( unsigned int device )`

**11.114.3.40 GetPOut()** `int GetPOut ( unsigned int channel )`

Gets the output power of the heating element.

**Parameters**

<i>channel</i>	The channel number.
----------------	---------------------

**Returns**

The resistance in units of mW.

**11.114.3.41 GetPwrOut()** `int GetPwrOut (`  
`unsigned int channel )`

**11.114.3.42 GetPwrSet()** `int GetPwrSet (`  
`unsigned int channel )`

**11.114.3.43 GetRes1()** `int GetRes1 (`  
`unsigned int channel )`

**11.114.3.44 GetRes2()** `int GetRes2 (`  
`unsigned int channel )`

**11.114.3.45 GetResS()** `int GetResS (`  
`unsigned int channel )`

**11.114.3.46 GetResX()** `int GetResX (`  
`unsigned int channel )`

**11.114.3.47 GetROut()** `int GetROut (`  
`unsigned int channel )`

Gets the resistance of the heating element.

## Parameters

<i>channel</i>	The channel number.
----------------	---------------------

## Returns

The resistance in units of 0.1 Ohm.

**11.114.3.48 GetSensorType()** `TcxSensorTypeEnumNet` GetSensorType (   
 unsigned int *device* )

**11.114.3.49 GetSetpoint()** `int` GetSetpoint (   
 unsigned int *channel* )

Gets the target temperate of specified channel in units of 0.1 °C.

**11.114.3.50 GetSetpointDecp()** `int` GetSetpointDecp (   
 unsigned int *channel* )

**11.114.3.51 GetSetpointMax()** `int` GetSetpointMax (   
 unsigned int *channel* )

**11.114.3.52 GetSetpointMin()** `int` GetSetpointMin (   
 unsigned int *channel* )

**11.114.3.53 GetThermocoupleCalibration()** `int` GetThermocoupleCalibration (   
 unsigned int *channel* )

**11.114.3.54 GetThermocoupleNanovoltPerKelvin()** `unsigned int` GetThermocoupleNanovoltPerKelvin (   
 unsigned int *channel* )

Gets the proportional constant for the thermocouple.

**Parameters**

<i>channel</i>	Thermocouple channel number.
----------------	------------------------------

**Returns**

The proportional constant in Nanovolt per Kelvin.

**11.114.3.55 GetThermocoupleReferenceTemp()** `int GetThermocoupleReferenceTemp ( unsigned int channel )`

**11.114.3.56 GetThermocoupleTemp()** `int GetThermocoupleTemp ( unsigned int channel )`

**11.114.3.57 GetThermocoupleTempAbs()** `int GetThermocoupleTempAbs ( unsigned int channel )`

**11.114.3.58 GetUnit()** `String ^ GetUnit ( unsigned int channel )`

**11.114.3.59 GetUOut()** `int GetUOut ( unsigned int channel )`

Gets the voltage on the heating element.

**Parameters**

<i>channel</i>	The channel number.
----------------	---------------------

**Returns**

The voltage in units of mV.

**11.114.3.60 GetValue()** `int GetValue (`  
`unsigned int channel )`

Gets the temperate of the specified channel in units of 0.1 °C.

**11.114.3.61 GetValueHires()** `int GetValueHires (`  
`unsigned int channel )`

Gets the temperate of the specified channel in units of 0.01 °C.

**11.114.3.62 GetVolti()** `unsigned int GetVolti (`  
`unsigned int channel )`

**11.114.3.63 SetCalibration()** `void SetCalibration (`  
`unsigned int channel,`  
`int calib )`

**11.114.3.64 SetD()** `void SetD (`  
`unsigned int device,`  
`int d_coeff )`

Sets the D-coefficient of the specified device.

**11.114.3.65 SetDevice()** `void SetDevice (`  
`unsigned int channel,`  
`int device )`

**11.114.3.66 SetDeviceType()** `void SetDeviceType (`  
`TcxDeviceTypeEnumNet devicetype )`

**11.114.3.67 SetDevname()** `void SetDevname (`  
`unsigned int device,`  
`String^ Devicename )`

**11.114.3.68 SetEnableHeaterLimit()** `void SetEnableHeaterLimit (`  
    `unsigned int device,`  
    `bool enable )`

**11.114.3.69 SetEnableThermocouple()** `void SetEnableThermocouple (`  
    `unsigned int device,`  
    `bool enable )`

**11.114.3.70 SetHeaterLimit()** `void SetHeaterLimit (`  
    `unsigned int device,`  
    `int heater_limit )`

**11.114.3.71 SetI()** `void SetI (`  
    `unsigned int device,`  
    `int i_coeff )`

Sets the I-coefficient of the specified device.

**11.114.3.72 SetMaxHeaterPowerMultiwell()** `void SetMaxHeaterPowerMultiwell (`  
    `double MaxPowerWatt )`

sets the max. heater power that the Multiwell temperature controller will apply; unit: W; useful range: 5.2W..7.6W

**11.114.3.73 SetMaxP()** `void SetMaxP (`  
    `unsigned int device,`  
    `int maxp )`

Sets the maximum heater power of the specified device.

**11.114.3.74 SetOnOff()** `void SetOnOff (`  
    `unsigned int channel,`  
    `bool on )`

Switches the specified channel on or off.

#### Parameters

<i>channel</i>	The channel number.
----------------	---------------------

**11.114.3.75 SetP()** `void SetP (`  
     `unsigned int device,`  
     `int p_coeff )`

Sets the P-coefficient of the specified device.

**11.114.3.76 SetSensorType()** `void SetSensorType (`  
     `unsigned int device,`  
     `TcxSensorTypeEnumNet type )`

**11.114.3.77 SetSetpoint()** `void SetSetpoint (`  
     `unsigned int channel,`  
     `int sp )`

Sets the target temperate of specified channel in units of 0.1 °C.

**11.114.3.78 SetThermocoupleNanovoltPerKelvin()** `void SetThermocoupleNanovoltPerKelvin (`  
     `unsigned int channel,`  
     `unsigned int value )`

Sets the proportional constant for the thermocouple.

#### Parameters

<i>channel</i>	Thermocouple channel number.
<i>value</i>	Proportional constant in Nanovolt per Kelvin.

## 11.115 CTEERFunctionNet Class Reference

[CTEERFunctionNet](#) is the class to control the TEER device

Inheritance diagram for CTEERFunctionNet:

*returns sample rate in Hz*

## Additional Inherited Members

### 11.115.1 Detailed Description

[CTEERFunctionNet](#) is the class to control the TEER device

### 11.115.2 Constructor & Destructor Documentation

**11.115.2.1 CTEERFunctionNet()** [1/2] [CTEERFunctionNet](#) (  
     CMcsUsbNet^ mcsusb,  
     CMcsUsbFunctionPointerContainer^ pTEERFunctionPointerContainer )

Initializes a new instance of the [CTEERFunctionNet](#) class.

**11.115.2.2 CTEERFunctionNet()** [2/2] `CTEERFunctionNet ( CMcsUsbNet^ mcsusb )`

**11.115.2.3 ~CTEERFunctionNet()** `virtual ~CTEERFunctionNet ( ) [virtual]`

**11.115.2.4 !CTEERFunctionNet()** `!CTEERFunctionNet ( )`

### 11.115.3 Member Function Documentation

**11.115.3.1 CancelInternalCalibration()** `void CancelInternalCalibration ( )`

in case the internal calibration "hangs", this will cancel it

**11.115.3.2 GetAdapterCode()** `uint32_t GetAdapterCode ( )`

gets the adapter code

#### Returns

the adapter code

**11.115.3.3 GetAdcOffsetU1()** `int GetAdcOffsetU1 ( )`

returns ADC offset of U1 channel (result of internal calibration)

#### Returns

the ADC offset for U1

**11.115.3.4 GetAdcOffsetU2()** `int GetAdcOffsetU2 ( )`

returns ADC offset of U2 channel (result of internal calibration)

#### Returns

the ADC offset for U2

**11.115.3.5 GetAmplitude\_nA()** `uint32_t GetAmplitude_nA ( )`

gets TEER stimulation amplitude in nA

**Returns**

current stimulation amplitude in nA

**11.115.3.6 GetBytesPerSample()** `uint32_t GetBytesPerSample ( )`

private function to be called internally only

**Returns**

not documented

**11.115.3.7 GetClampMode()** `TeerClampModeEnumNet GetClampMode ( )`

gets TEER clamp mode (voltage/current)

**Returns**

current TEER clamp mode

**11.115.3.8 GetControllerParams()** `void GetControllerParams ( [System::Runtime::InteropServices::Out] uint32_t% P, [System::Runtime::InteropServices::Out] uint32_t% I, [System::Runtime::InteropServices::Out] uint32_t% D )`

gets PID controller parameters for voltage clamp mode

**Parameters**

<i>P</i>	the P value
<i>I</i>	the I value
<i>D</i>	the D value

**11.115.3.9 GetCurrentEnable()** `bool GetCurrentEnable ( )`

when disabled, no current will flow through chamber

**Returns**

false when disabled, true when enabled

**11.115.3.10 GetDacZero()** `int GetDacZero ( )`

returns DAC-offset (result of internal calibration); use to check for plausibility only

**Returns**

the DAC offset

**11.115.3.11 GetFrameErrorCounter()** `int GetFrameErrorCounter ( )`

returns number of times (since bootup) sample memory got overwritten

**Returns**

the number of errors

**11.115.3.12 GetLiquidResistance()** `int32_t GetLiquidResistance ( )`

gets the resistance of the liquid in ohms

**Returns**

the resistance in ohms

**11.115.3.13 GetMaxChunkSize\_Byte()** `uint32_t GetMaxChunkSize_Byte ( )`

private function to be called internally only

**Returns**

not documented

**11.115.3.14 GetNumberOfAvailableSamples()** `uint32_t GetNumberOfAvailableSamples ( )`

private function to be called internally only

**Returns**

not documented

**11.115.3.15 GetPeriod\_us()** `uint32_t GetPeriod_us ( )`

gets the period of TEER stimulation in us

**Returns**

the period in us

**11.115.3.16 GetRotaryPositionCode()** `uint32_t GetRotaryPositionCode ( )`

gets the rotary position code

**Returns**

the rotary position code

**11.115.3.17 GetSampleBufferChunk()** `array<int32_t> ^ GetSampleBufferChunk ( int Buffer_Length )`

private function to query max. 100 bytes of sample buffer; called internally

**Parameters**

<i>Buffer_Length</i>	The maximal length of Buffer.
----------------------	-------------------------------

**Returns**

not documented

**11.115.3.18 GetSampleRate()** `int GetSampleRate ( )`

returns sample rate in Hz

**Returns**

the sample rate in Hz

**11.115.3.19 GetSampleVoltageBuffer\_uV()** `array<int32_t> ^ GetSampleVoltageBuffer_uV (`  
`int Buffer_Length )`

returns voltage sample buffer (max. 500 values); unit: uV

**Parameters**

<i>Buffer_Length</i>	The maximal length of Buffer.
----------------------	-------------------------------

**Returns**

the voltage sample buffer

**11.115.3.20 GetScaleFactorU1()** `int GetScaleFactorU1 ( )`

returns U1 scale factor times  $10^6$  (result of internal calibration)

**Returns**

the U1 scale factor

**11.115.3.21 GetScaleFactorU2()** `int GetScaleFactorU2 ( )`

returns U2 scale factor times  $10^6$  (result of internal calibration)

**Returns**

the U2 scale factor

**11.115.3.22 GetUptimeSeconds()** `int32_t GetUptimeSeconds ( )`

returns time in seconds since device was powered up

**Returns**

seconds since power-on

**11.115.3.23 GetWaveform()** [TeerWaveformEnumNet](#) GetWaveform ( )

gets TEER stimulation waveform (sine/rect)

**Returns**

waveform enum

**11.115.3.24 IsInternalCalibrationFinished()** [bool](#) IsInternalCalibrationFinished ( )

queries whether internal calibration has finished

**Returns**

true if calibration has finished

**11.115.3.25 IsSamplingFinished()** [uint32\\_t](#) IsSamplingFinished ( )

returns false iff stimulation/sampling is going on, otherwise true

**Returns**

true if sampling is finished

**11.115.3.26 SetAmplitude\_nA()** [void](#) SetAmplitude\_nA ( [uint32\\_t](#) *Amplitude\_nA* )

sets TEER stimulation amplitude in nA

**Parameters**

<i>Amplitude_nA</i>	new stimulation amplitude in nA
---------------------	---------------------------------

**11.115.3.27 SetBufferIndex()** [void](#) SetBufferIndex ( [uint32\\_t](#) *NewBufferIndex* )

pre-selects sample buffer to be transferred by [GetSampleVoltageBuffer\\_uV\(\)](#)

**Parameters**

<i>NewBufferIndex</i>	0 - chamber voltage; 1 - compliance voltage
-----------------------	---

**11.115.3.28 SetClampMode()** `void SetClampMode (`  
    `TeerClampModeEnumNet ClampMode )`

sets TEER clamp mode (voltage/current)

Parameters

<i>ClampMode</i>	new TEER clamp mode
------------------	---------------------

**11.115.3.29 SetControllerParams()** `void SetControllerParams (`  
    `uint32_t P,`  
    `uint32_t I,`  
    `uint32_t D )`

sets PID controller parameters for voltage clamp mode

Parameters

<i>P</i>	the P value
<i>I</i>	the I value
<i>D</i>	the D value

**11.115.3.30 SetCurrentEnable()** `void SetCurrentEnable (`  
    `bool NewCurrentEnable )`

when disabled, no current will flow through chamber

Parameters

<i>NewCurrentEnable</i>	disabled when false, enabled when true
-------------------------	--

**11.115.3.31 SetExternalLED()** `void SetExternalLED (`  
    `uint32_t NewState )`

sets the external LED

Parameters

<i>NewState</i>	state
-----------------	-------

**11.115.3.32 SetLiquidResistance()** `void SetLiquidResistance (`  
`int32_t NewLiquidResistance_Ohm )`

sets the resistance of the liquid in ohms

**Parameters**

<i>NewLiquidResistance_Ohm</i>	the resistance in ohms
--------------------------------	------------------------

**11.115.3.33 SetPeriod\_us()** `void SetPeriod_us (`  
`uint32_t period_us )`

sets the period of TEER stimulation in us

**Parameters**

<i>period_us</i>	the period in us
------------------	------------------

**11.115.3.34 SetWaveform()** `void SetWaveform (`  
`TeerWaveformEnumNet Waveform )`

sets TEER stimulation waveform (sine/rect)

**Parameters**

<i>Waveform</i>	waveform enum
-----------------	---------------

**11.115.3.35 StartInternalCalibration()** `void StartInternalCalibration ( )`

starts determination of internal DAC-offset; result is used internally; NON-BLOCKING call

**11.115.3.36 StartSampling()** `void StartSampling (`  
`uint32_t NumberOfCycles )`

starts TEER stimulation (duration: n cycles) and samples during last cycle

## Parameters

<i>NumberOfCycles</i>	number of cycles (sine or rect) to output (0 - loop forever)
-----------------------	--

**11.115.3.37 StopSampling()** `void StopSampling ( )`

stops TEER stimulation and sampling

**11.117.2.3 ~CUsbDeviceConfigurationFunctionNet()** `virtual ~CUsbDeviceConfigurationFunctionNet ( ) [virtual]`

**11.117.2.4 !CUsbDeviceConfigurationFunctionNet()** `!CUsbDeviceConfigurationFunctionNet ( )`

### 11.117.3 Member Function Documentation

**11.117.3.1 SetDeviceId()** `void SetDeviceId ( ProductIdEnumNet id )`

sets the USB device name for configurable devices

#### Parameters

<i>id</i>	
-----------	--

**11.117.3.2 SetDeviceName()** `void SetDeviceName ( String^ name )`

sets the USB device name for configurable devices

#### Parameters

<i>name</i>	
-------------	--

## 11.118 CUsbExceptionNet Class Reference

Exception class that is thrown in case of an USB error.

Inheritance diagram for CUsbExceptionNet:

## Public Member Functions

- [CUsbExceptionNet](#) (uint32\_t status)  
*Constructor of a CUsbException.*
- [CUsbExceptionNet](#) (uint32\_t status, String^ message)

## Properties

- uint32\_t [Status](#) [get]

### 11.118.1 Detailed Description

Exception class that is thrown in case of an USB error.

### 11.118.2 Constructor & Destructor Documentation

#### 11.118.2.1 CUsbExceptionNet() [1/2] [CUsbExceptionNet](#) ( uint32\_t status )

Constructor of a CUsbException.

#### Parameters

<i>status</i>	the status number
---------------	-------------------

#### 11.118.2.2 CUsbExceptionNet() [2/2] [CUsbExceptionNet](#) ( uint32\_t status, String^ message )

### 11.118.3 Property Documentation

#### 11.118.3.1 Status uint32\_t Status [get]

[CMcsUsbNet](#)<sup>^</sup> *mcsusb* )

#### 11.121.2 Member Function Documentation

**11.121.2.1 ClearChannelData()** void [ClearChannelData](#) (  
int *channel* )

Delete a Stimulus Pattern from STG memory

#### Parameters

<i>channel</i>	specifies the channel to clear.
----------------	---------------------------------

**11.121.2.2 GetBoostAlwaysOnMode()** `uint32_t GetBoostAlwaysOnMode ( )`

**11.121.2.3 GetBoostPreTime()** `uint32_t GetBoostPreTime ( )`

**11.121.2.4 GetCurrentRangeInNanoAmp()** `int GetCurrentRangeInNanoAmp (   
uint32_t channel )`

Gets the Current Range of the specified channel in Nanoamps.

**Parameters**

<i>channel</i>	Channel which is queried.
----------------	---------------------------

**Returns**

The Current Range of the specified channel in Nanoamps.

**11.121.2.5 GetCurrentResolutionInNanoAmp()** `int GetCurrentResolutionInNanoAmp (   
uint32_t channel )`

Gets the Current Resolution of the specified channel in Nanoamps.

**Parameters**

<i>channel</i>	Channel which is queried.
----------------	---------------------------

**Returns**

The Current Resolution of the specified channel in Nanoamps.

**11.121.2.6 GetDACResolution()** `int GetDACResolution ( )`

Gets number of bits of the DAC resolution.

**Returns**

The DAC resolution in bits.

**11.121.2.7 GetDigitalStimulatorTrigger()** void GetDigitalStimulatorTrigger (

```

    int TimeSlotNr,
    DigitalStimulatorTriggerEventEnumNet trigger_event,
    int trigger_number,
    [System::Runtime::InteropServices::Out] W2100DigitalSourceEnumNet% digstream_↵
source,
    [System::Runtime::InteropServices::Out] int% bitnumber_offset )

```

**11.121.2.8 GetDigitalStimulatorTriggerSlope()** DigitalStimulatorTriggerSlopeEnumNet GetDigital↵

```

StimulatorTriggerSlope (
    int TimeSlotNr,
    DigitalStimulatorTriggerEventEnumNet trigger_event,
    int trigger_number )

```

**11.121.2.9 GetNumberOfAnalogChannels()** uint32\_t GetNumberOfAnalogChannels ( )

**11.121.2.10 GetNumberOfSyncoutChannels()** uint32\_t GetNumberOfSyncoutChannels ( )

**11.121.2.11 GetNumberOfTriggerInputs()** uint32\_t GetNumberOfTriggerInputs ( )

**11.121.2.12 GetStimulationPatternMemory()** uint32\_t GetStimulationPatternMemory ( )

**11.121.2.13 GetTimeResolutionInNanoSeconds()** int GetTimeResolutionInNanoSeconds ( )

Gets number of bits of the DAC resolution.

#### Returns

The time resolution in ns.

**11.121.2.14 GetTimeSlot()** int GetTimeSlot ( )

**11.121.2.15 GetVoltageRangeInMicroVolt()** int GetVoltageRangeInMicroVolt (

```

    uint32_t channel )

```

Gets the Voltage Range of the specified channel in Microvolts.

**Parameters**

<i>channel</i>	Channel which is queried.
----------------	---------------------------

**Returns**

The Voltage Range of the specified channel in Microvolts.

**11.121.2.16 GetVoltageResolutionInMicroVolt()** `int GetVoltageResolutionInMicroVolt ( uint32_t channel )`

Gets the Voltage Resolution of the specified channel in Microvolts.

**Parameters**

<i>channel</i>	Channel which is queried.
----------------	---------------------------

**Returns**

The Voltage Resolution of the specified channel in Microvolts.

**11.121.2.17 PrepareData()** `CStimulusFunctionNet::StimulusDeviceDataAndUnrolledData ^ PrepareData (`

```
int channel,
array< int32_t >^ amplitude,
array< uint64_t >^ duration,
STG_DestinationEnumNet destType,
uint32_t repeat )
```

**11.121.2.18 PrepareDataSync()** `CStimulusFunctionNet::StimulusDeviceDataAndUnrolledData ^ PrepareDataSync (`

```
int channel,
array< int32_t >^ amplitude,
array< uint32_t >^ Sync,
array< uint64_t >^ duration,
STG_DestinationEnumNet destType,
uint32_t repeat )
```

**11.121.2.19 SelectTimeSlot()** `void SelectTimeSlot ( int TimeSlotNr )`

**11.121.2.20 SendPreparedData()** void SendPreparedData (   
     int *channel*,   
     CStimulusFunctionNet::StimulusDeviceDataAndUnrolledData^ *device\_data\_and\_unrolled*,   
     STG\_DestinationEnumNet *destType* )

**11.121.2.21 SendStart()** void SendStart (   
     uint32\_t *triggermap* )

Start (Trigger) the STG. The startup delay is in the range of a few ms.

#### Parameters

<i>triggermap</i>	A bitmap of triggers which will be started.
-------------------	---

**11.121.2.22 SendStop()** void SendStop (   
     uint32\_t *triggermap* )

Stop some or all triggers of the STG.

#### Parameters

<i>triggermap</i>	A bitmap of triggers which will be stopped.
-------------------	---

**11.121.2.23 SetDigitalStimulatorTrigger()** void SetDigitalStimulatorTrigger (   
     int *TimeSlotNr*,   
     DigitalStimulatorTriggerEventEnumNet *trigger\_event*,   
     int *trigger\_number*,   
     W2100DigitalSourceEnumNet *digstream\_source*,   
     int *bitnumber\_offset* )

*query the range of the high current mode*
- uint32\_t [GetDacPampsPerDigitLowCurrentRange](#) (int32\_t ChamberId)  
*get the resolution of the low current mode*
- uint32\_t [GetDacPampsPerDigitHighCurrentRange](#) (int32\_t ChamberId)  
*get the resolution of the high current mode*
- uint32\_t [GetUnitsPerDigit](#) (int32\_t ChamberId, int32\_t ChannelId)  
*gets amps/volts per digit for specified chamber and channel*
- int32\_t [GetUnitExponent](#) (int32\_t ChamberId, int32\_t ChannelId)  
*gets the unit exponent for specified chamber and channel*
- [UssingUnitEnumNet](#) [GetUnitName](#) (int32\_t ChamberId, int32\_t ChannelId)  
*gets the channel's unit name*
- String ^ [GetUnitDescription](#) (int32\_t ChamberId, int32\_t ChannelId)  
*gets the description for the unit*
- array< int > ^ [GetAvailableChambers](#) ()  
*returns array with (zero-based) ChamberIds of all available chambers*
- int32\_t [GetUptimeSeconds](#) (int32\_t ChamberId)  
*gets the uptime in seconds*
- void [SetIdleModeOffset](#) (int32\_t ChamberId, [UssingClampModeEnumNet](#) ClampMode, int32\_t NewIdleOffset)  
*sets the offset (voltage or current) that will be applied when clamping is DISABLED*
- int32\_t [GetIdleModeOffset](#) (int32\_t ChamberId, [UssingClampModeEnumNet](#) ClampMode)  
*gets the offset (voltage or current) that will be applied when clamping is DISABLED*
- void [SetEnablePulse](#) (int32\_t ChamberId, [UssingClampModeEnumNet](#) ClampMode, bool Enable)  
*enable pulse of given chamber and mode (voltage/current clamp) of this chamber*

- bool [IsPulseEnabled](#) (int32\_t ChamberId, [UssingClampModeEnumNet](#) ClampMode)  
*returns true when pulse of given chamber and current mode (voltage/current clamp) of this chamber is ENABLED*
- void [SetLiquidResistance](#) (int32\_t ChamberId, int32\_t NewLiquidResistance\_Ohm)  
*sets the resistance of the liquid*
- int32\_t [GetLiquidResistance](#) (int32\_t ChamberId)  
*gets the resistance of the liquid*
- int32\_t [GetComplianceVoltageThreshold](#) (int32\_t ChamberId)  
*returns compliance voltage threshold in uV; when Uc is above, current source is overloaded*
- bool [CompensateElectrodeOffset](#) (int32\_t ChamberId)  
*blocking call to compensate electrode offset of one chamber; returns true when successful*
- bool [WaitForChamber](#) (int32\_t ChamberId)  
*blocking call that waits for chamber boot-up calibration to complete*
- bool [WaitForAllChambers](#) ()  
*blocking call that waits for ALL chambers' boot-up calibration to complete*

## Additional Inherited Members

### 11.124.1 Detailed Description

[CWarnerUssingFunctionNet](#) is the class to control the Ussing device

### 11.124.2 Constructor & Destructor Documentation

**11.124.2.1 CWarnerUssingFunctionNet()** [1/2] [CWarnerUssingFunctionNet](#) (  
[CMcsUsbNet](#)<sup>^</sup> mcsusb,  
[CMcsUsbFunctionPointerContainer](#)<sup>^</sup> pWarnerUssingFunctionPointerContainer )

Initializes a new instance of the [CWarnerUssingFunctionNet](#) class.

**11.124.2.2 CWarnerUssingFunctionNet()** [2/2] [CWarnerUssingFunctionNet](#) (  
[CMcsUsbNet](#)<sup>^</sup> mcsusb )

**11.124.2.3 ~CWarnerUssingFunctionNet()** virtual [~CWarnerUssingFunctionNet](#) ( ) [virtual]

**11.124.2.4 "!CWarnerUssingFunctionNet()** [!CWarnerUssingFunctionNet](#) ( )

### 11.124.3 Member Function Documentation

**11.124.3.1 CompensateElectrodeOffset()** bool [CompensateElectrodeOffset](#) (  
int32\_t ChamberId )

blocking call to compensate electrode offset of one chamber; returns true when successful

**Parameters**

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
------------------------	---

**Returns**

true if compensation succeeded

**11.124.3.2 GetAvailableChambers()** `array<int> ^ GetAvailableChambers ( )`

returns array with (zero-based) ChamberIds of all available chambers

**11.124.3.3 GetChannelsCountOfChamber()** `int32_t GetChannelsCountOfChamber (   
int32_t ChamberId )`

gets number of channels in datastream from chamber amp with given index

**Parameters**

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
------------------------	---

**Returns**

return value of zero means that amp is not placed

**11.124.3.4 GetClampMode()** `UssingClampModeEnumNet GetClampMode (   
int32_t ChamberId )`

gets clamp mode (voltage, current or open clamp; do not use when device is in internal calibration mode)

**Parameters**

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
------------------------	---

**Returns**

the current clamp mode

**11.124.3.5 GetComplianceVoltageThreshold()** `int32_t GetComplianceVoltageThreshold (`  
`int32_t ChamberId )`

returns compliance voltage threshold in uV; when  $U_c$  is above, current source is overloaded

**Parameters**

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
------------------	---

**Returns**

the compliance voltage threshold in uV

**11.124.3.6 GetDacPampsPerDigitHighCurrentRange()** `uint32_t GetDacPampsPerDigitHighCurrentRange`  
`(`  
`int32_t ChamberId )`

get the resolution of the high current mode

**Parameters**

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
------------------	---

**Returns**

unit: pA/digit in high current mode

**11.124.3.7 GetDacPampsPerDigitLowCurrentRange()** `uint32_t GetDacPampsPerDigitLowCurrentRange (`  
`int32_t ChamberId )`

get the resolution of the low current mode

**Parameters**

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
------------------	---

**Returns**

pA/digit in low current mode

**11.124.3.8 GetDacZero()** `int32_t GetDacZero (`  
`int32_t ChamberId )`

- diagnostic function only - ; gets real zero value of DAC in digits (0 -> neg. current; 32767 -> near zero; 65535 -> pos. current)

#### Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
------------------	---

#### Returns

the zero value of the DAC

**11.124.3.9 GetHighCurrentRange()** `uint32_t GetHighCurrentRange (`  
`int32_t ChamberId )`

query the range of the high current mode

#### Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
------------------	---

#### Returns

low current range in nA

**11.124.3.10 GetIdleModeOffset()** `int32_t GetIdleModeOffset (`  
`int32_t ChamberId,`  
`UssingClampModeEnumNet ClampMode )`

gets the offset (voltage or current) that will be applied when clamping is DISABLED

#### Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
<i>ClampMode</i>	voltage or current clamp stimulation

#### Returns

unit: nA or uV

**11.124.3.11 GetLiquidResistance()** `int32_t GetLiquidResistance (`  
`int32_t ChamberId )`

gets the resistance of the liquid

**Parameters**

<i>Chamber↵ Id</i>	index of hardware chamber slot (zero-based)
------------------------	---

**Returns**

the liquid restistance in ohm

**11.124.3.12 GetLowCurrentRange()** `uint32_t GetLowCurrentRange (`  
`int32_t ChamberId )`

query the range of the low current mode

**Parameters**

<i>Chamber↵ Id</i>	index of hardware chamber slot (zero-based)
------------------------	---

**Returns**

low current range in nA

**11.124.3.13 GetNumberOfAvailableChambers()** `int32_t GetNumberOfAvailableChambers ( )`

gets number of actually connected chamber amps

**Returns**

the number of actually connected chambers

**11.124.3.14 GetNumberOfHardwareSlotsForChambers()** `int32_t GetNumberOfHardwareSlotsFor↵  
Chambers ( )`

gets number of physical hardware slots for chambers amps

**Returns**

the number of hardware chamber slots on the backplane

**11.124.3.15 GetU1Offset()** `int32_t GetU1Offset (`  
`int32_t ChamberId )`

- diagnostic function only -

**Parameters**

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
------------------------	---

**Returns**

U1 offset

**11.124.3.16 GetU1Reference()** `int32_t GetU1Reference (`  
`int32_t ChamberId )`

- diagnostic function only -

**Parameters**

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
------------------------	---

**Returns**

U1 reference

**11.124.3.17 GetU2Offset()** `int32_t GetU2Offset (`  
`int32_t ChamberId )`

- diagnostic function only -

**Parameters**

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
------------------------	---

**Returns**

U2 offset

**11.124.3.18 GetU2Reference()** `int32_t GetU2Reference (`  
`int32_t ChamberId )`

- diagnostic function only -

**Parameters**

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
------------------------	---

**Returns**

U2 reference

**11.124.3.19 GetUnitDescription()** `String ^ GetUnitDescription (`  
    `int32_t ChamberId,`  
    `int32_t ChannelId )`

gets the description for the unit

**Parameters**

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
<i>ChannelId</i>	index of channel (zero-based)

**Returns**

the description of the unix

**11.124.3.20 GetUnitExponent()** `int32_t GetUnitExponent (`  
    `int32_t ChamberId,`  
    `int32_t ChannelId )`

gets the unit exponent for specified chamber and channel

**Parameters**

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
<i>ChannelId</i>	index of channel (zero-based)

**Returns**

example: return value -9 means that amps/volts per digit is in nano

**11.124.3.21 GetUnitName()** `UssingUnitEnumNet GetUnitName (`  
    `int32_t ChamberId,`  
    `int32_t ChannelId )`

gets the channel's unit name

**Parameters**

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
<i>ChannelId</i>	index of channel (zero-based)

**Returns**

the name of the unit

**11.124.3.22 GetUnitsPerDigit()** `uint32_t GetUnitsPerDigit (`  
    `int32_t ChamberId,`  
    `int32_t ChannelId )`

gets amps/volts per digit for specified chamber and channel

**Parameters**

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
<i>ChannelId</i>	index of channel (zero-based)

**Returns**

amps/volts per digit

**11.124.3.23 GetUptimeSeconds()** `int32_t GetUptimeSeconds (`  
    `int32_t ChamberId )`

gets the uptime in seconds

**Parameters**

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
------------------	---

**Returns**

seconds since power-on

**11.124.3.24 GetVoltageClampControllerParam\_D()** `uint32_t GetVoltageClampControllerParam_D (int32_t ChamberId )`

gets D value of PID controller;

#### Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
------------------	---

#### Returns

the D value

**11.124.3.25 GetVoltageClampControllerParam\_I()** `uint32_t GetVoltageClampControllerParam_I (int32_t ChamberId )`

gets I value of PID controller;

#### Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
------------------	---

#### Returns

the I value

**11.124.3.26 GetVoltageClampControllerParam\_P()** `uint32_t GetVoltageClampControllerParam_P (int32_t ChamberId )`

gets P value of PID controller;

#### Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
------------------	---

#### Returns

the P value

**11.124.3.27 IsChamberAvailable()** `bool IsChamberAvailable (`  
    `int32_t ChamberId )`

checks whether chamber amp is connected to slot

**Parameters**

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
------------------------	---

**Returns**

true if the chamber is available

**11.124.3.28 IsHighCurrentMode()** `bool IsHighCurrentMode (`  
    `int32_t ChamberId )`

**Parameters**

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
------------------------	---

**Returns**

true if in hight current mode

**11.124.3.29 IsInternalCalibrationFinished()** `bool IsInternalCalibrationFinished (`  
    `int32_t ChamberId )`

when internal calibration is finished, values for U1,2\_offset and U1,2\_reference and DAC\_offset are available

**Parameters**

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
------------------------	---

**Returns**

true if finished

**11.124.3.30 IsPulseEnabled()** `bool IsPulseEnabled (`  
    `int32_t ChamberId,`  
    `UssingClampModeEnumNet ClampMode )`

returns true when pulse of given chamber and current mode (voltage/current clamp) of this chamber is ENABLED

## Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
<i>ClampMode</i>	voltage or current clamp stimulation

## Returns

when ENABLED, previously defined pulse pattern will be applied, otherwise the chamber current/voltage will be kept at specified offset level

**11.124.3.31 SetClampMode()** `void SetClampMode (`  
     `int32_t ChamberId,`  
     `UssingClampModeEnumNet NewClampMode )`

sets clamp mode (voltage, current or open clamp)

## Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
<i>NewClampMode</i>	the clamp mode to use

**11.124.3.32 SetEnablePulse()** `void SetEnablePulse (`  
     `int32_t ChamberId,`  
     `UssingClampModeEnumNet ClampMode,`  
     `bool Enable )`

enable pulse of given chamber and mode (voltage/current clamp) of this chamber

## Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
<i>ClampMode</i>	voltage or current clamp stimulation
<i>Enable</i>	when ENABLED, previously defined pulse pattern will be applied, otherwise the chamber current/voltage will be kept at specified offset level

**11.124.3.33 SetHighCurrentMode()** `void SetHighCurrentMode (`  
     `int32_t ChamberId )`

switch to high-current mode

## Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
------------------	---

**11.124.3.34 SetIdleModeOffset()** `void SetIdleModeOffset (`  
`int32_t ChamberId,`  
`UssingClampModeEnumNet ClampMode,`  
`int32_t NewIdleOffset )`

sets the offset (voltage or current) that will be applied when clamping is DISABLED

## Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
<i>ClampMode</i>	voltage or current clamp stimulation
<i>NewIdleOffset</i>	unit: nA or uV

**11.124.3.35 SetLiquidResistance()** `void SetLiquidResistance (`  
`int32_t ChamberId,`  
`int32_t NewLiquidResistance_Ohm )`

sets the resistance of the liquid

## Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
<i>NewLiquidResistance_Ohm</i>	the liquid resistance in ohm

**11.124.3.36 SetLowCurrentMode()** `void SetLowCurrentMode (`  
`int32_t ChamberId )`

switch to low-current mode

## Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
------------------	---

**11.124.3.37 SetPulse()** `void SetPulse (`  
`int32_t ChamberId,`

```
UssingClampModeEnumNet StgMode,
int32_t NumberOfRepetitions,
array< int >^ Amplitudes,
array< int >^ Durations,
array< int >^ PulseMarker )
```

defines stimulation pulse pattern for voltage or current stimulation; CAUTION: zero-length amplitude will be briefly applied -> choose matching to neighbour to avoid spikes

#### Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based); send pattern to connected amp
<i>StgMode</i>	voltage or current clamp stimulation
<i>NumberOfRepetitions</i>	number of repetitions for pulse pattern (-1 for infinite; n means pattern is applied n+1 times)
<i>Amplitudes</i>	amplitude; unit in voltage clamp: uV; unit in current clamp: nA
<i>Durations</i>	duration in 100us; CAUTION: first element is applied only one; auto-loop back to second element after last one
<i>PulseMarker</i>	defines values on digital channel for each step (positive: digital channel "01", neg: "10", zero: "00")

**11.124.3.38 SetVoltageClampControllerParam\_D()** void SetVoltageClampControllerParam\_D (   
int32\_t ChamberId,   
uint32\_t D )

sets D value of PID controller;

#### Parameters

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
<i>D</i>	useful range: 0..700

**11.124.3.39 SetVoltageClampControllerParam\_I()** void SetVoltageClampControllerParam\_I (   
int32\_t ChamberId,   
uint32\_t I )

sets I value of PID controller;

#### Parameters

<i>Chamber↔ Id</i>	index of hardware chamber slot (zero-based)
<i>I</i>	useful range: 80000..120000

**11.124.3.40 SetVoltageClampControllerParam\_P()** `void SetVoltageClampControllerParam_P (`  
`int32_t ChamberId,`  
`uint32_t P )`

sets P value of PID controller;

#### Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
<i>P</i>	useful value: 130000

**11.124.3.41 WaitForAllChambers()** `bool WaitForAllChambers ( )`

blocking call that waits for ALL chambers' boot-up calibration to complete

#### Returns

returns false when at least one chamber's calibration fails (e.g. timeout...)

**11.124.3.42 WaitForChamber()** `bool WaitForChamber (`  
`int32_t ChamberId )`

blocking call that waits for chamber boot-up calibration to complete

#### Parameters

<i>ChamberId</i>	index of hardware chamber slot (zero-based)
------------------	---

#### Returns

returns false when calibration fails (e.g. timeout...)

## 11.125 CWarnerValveControllerDeviceNet Class Reference

[CWarnerValveControllerDeviceNet](#) is the class to access the Warner Valve Controller

Inheritance diagram for CWarnerValveControllerDeviceNet:

  - bool [IsValveDigitalInInverted](#) (uint16\_t valve)
- Is digital in inverted*
  - void [SetValveDigitalInInvert](#) (uint16\_t valve, bool isInverted)
- Invert digital in*
  - uint32\_t [GetValveDigitalInPort](#) (uint16\_t valve)
- Gets the number of the digital in port which is mapped to a valve*
  - void [SetValveDigitalInPort](#) (uint16\_t valve, uint32\_t digitalInPort)
- Map a digital in port to a valve*
  - bool [IsDigitalOutPortInverted](#) (uint16\_t digitalOutPort)
- Gets the number of the valve which is mapped to a digital out port*
  - void [SetDigitalOutPortInvert](#) (uint16\_t digitalOutPort, bool isInverted)
- Map a valve to a digital out port*
  - uint32\_t [GetDigitalOutPortValve](#) (uint16\_t digitalOutPort)
- Gets the number of the valve which is mapped to a digital out port*
  - void [SetDigitalOutPortValve](#) (uint16\_t digitalOutPort, uint32\_t valve)
- Map a valve to a digital out port*
  - void [SetDefault](#) ()
- Sets the settings of the valve controller to default*
  - bool [IsValveOpen](#) (uint16\_t valve)
- Is valve open*
  - bool [IsValveOpenInDigitalMode](#) (uint16\_t valve)
- True, if the valve would be open when the device is in digital mode*
  - bool [IsValveOpenInAnalogMode](#) (uint16\_t valve)
- True, if the valve would be open when the device is in analog mode*
  - int32\_t [GetAnalogVoltage](#) ()
- Reads the voltage on the analog in port*
  - void [GetValveTableEntry](#) (uint16\_t valve, uint16\_t index, [System::Runtime::InteropServices::Out]uint32\_t% duration, [System::Runtime::InteropServices::Out]bool% state)
- Read an entry from the valve protocol table*
  - void [SetValveTableEntry](#) (uint16\_t valve, uint16\_t index, uint32\_t duration, bool state)
- Write an entry to the valve protocol table*
  - void [ClearValveTable](#) (uint16\_t valve)
- Clear the valve protocol table*
  - void [LoadValveTable](#) ()
- Load the current table from permanent memory*
  - void [StoreValveTable](#) ()
- Store the current table in permanent memory*
  - String ^ [GetTableNamebyIndex](#) (uint16\_t tableNumber)
- Get the name of a protocol table*
  - String ^ [GetTableName](#) ()

- Get the name of the current protocol table*

  - void [SetTableName](#) (String^ tableName)

*Set the name of the current protocol table*
- uint32\_t [GetActiveRunningTableNumber](#) ()

*Gets the number of the table that is active for running*
- void [SetActiveRunningTableNumber](#) (uint32\_t tableName)

*Sets the number of the tanle that is active for running*
- uint32\_t [GetCurrentEditTableNumber](#) ()

*Gets the number of the table that is current for editing*
- void [SetCurrentEditTableNumber](#) (uint32\_t tableName)

*Sets the number of the table that is current for editing*
- void [ClearTableName](#) ()

*Clear the name of current protocol table*
- void [SetTableStep](#) (uint16\_t valve, int32\_t steps)

*Skips the table protocol for a valve by steps*
- void [SetTableStepAll](#) (int32\_t steps)

*Skips the table protocol for all valves by steps*
- int32\_t [GetTotalNumberOfValves](#) ()

*Get the total number of valves in the system*
- int32\_t [GetTotalNumberOfDigitalPorts](#) ()

*Get the total number of digital ports in the system*
- int32\_t [GetTotalTableSize](#) ()

*Get the total table size in the system*
- int32\_t [GetTotalNumberOfTables](#) ()

*Get the total number of tables in the system*
- int32\_t [GetCurrentNumberOfValves](#) ()

*Get the current number of valves connected to the system*
- uint32\_t [GetValveBoardRevision](#) ()

*Gets the revision code of the valve board*
- bool [GetValveLedOn](#) ()

*Gets the LED state of the valve board*
- void [SetValveLedOn](#) (bool ledon)

*Gets the LED state of the valve board*
- [WvcDisplayModeEnumNet](#) [GetDisplayMode](#) ()

*Reads the display mode*
- void [SetDisplayMode](#) ([WvcDisplayModeEnumNet](#) DisplayMode, int32\_t lockTimeMs)

*Writes the display mode*
- String ^ [GetValveBoardRevisionString](#) ()

*Gets the revision name of the valve board*
- void [GetValveCurrent](#) ([System::Runtime::InteropServices::Out]int16\_t% switch\_current, [System::Runtime::InteropServices::Out]int16\_t% hold\_current)

*Gets the valve currents*
- void [SetValveCurrent](#) (int16\_t switch\_current, int16\_t hold\_current)

*Sets the valve currents different from the default*

## Events

- [OnGetValveActive](#)^ [GetValveActiveEvent](#) [add, remove, raise]  
*Event fires when the valve state for the valve number has changed*
- [OnGetValveManualState](#)^ [GetValveManualStateEvent](#) [add, remove, raise]  
*Event fires when the manual valve state for the valve number has changed*
- [OnGetValveManualGroup](#)^ [GetValveManualGroupEvent](#) [add, remove, raise]  
*Event fires when the manual valve group for the valve number has changed*
- [OnGetValveMode](#)^ [GetValveModeEvent](#) [add, remove, raise]  
*Event fires when the valve mode for the valve number has changed*
- [OnGetAnalogThresholdLow](#)^ [GetAnalogThresholdLowEvent](#) [add, remove, raise]  
*Event fires when the threshold in mV for the valve number has changed*
- [OnGetAnalogThresholdHigh](#)^ [GetAnalogThresholdHighEvent](#) [add, remove, raise]  
*Event fires when the threshold in mV for the valve number has changed*
- [OnGetDigitalPortDirection](#)^ [GetDigitalPortDirectionEvent](#) [add, remove, raise]  
*Event fires when the direction for the port number has changed*
- [OnIsValveDigitalInInverted](#)^ [IsValveDigitalInInvertedEvent](#) [add, remove, raise]  
*Event fires when is inverted for the valve number has changed*
- [OnGetValveDigitalInPort](#)^ [GetValveDigitalInPortEvent](#) [add, remove, raise]  
*Event fires when the digital in port for the valve number has changed*
- [OnIsDigitalOutPortInverted](#)^ [IsDigitalOutPortInvertedEvent](#) [add, remove, raise]  
*Event fires when is inverted for the digital out port has changed*
- [OnGetDigitalOutPortValve](#)^ [GetDigitalOutPortValveEvent](#) [add, remove, raise]  
*Event fires when the valve number for the digital out port has changed*
- [OnIsValveOpen](#)^ [IsValveOpenEvent](#) [add, remove, raise]  
*Event fires when is open for the valve number has changed*
- [OnIsValveOpenInDigitalMode](#)^ [IsValveOpenInDigitalModeEvent](#) [add, remove, raise]  
*Event fires when is open for the valve number has changed*
- [OnIsValveOpenInAnalogMode](#)^ [IsValveOpenInAnalogModeEvent](#) [add, remove, raise]  
*Event fires when is open for the valve number has changed*
- [OnGetAnalogVoltage](#)^ [GetAnalogVoltageEvent](#) [add, remove, raise]  
*Event fires when the voltage in mV has changed*
- [OnTableEntryChanged](#)^ [TableEntryChangedEvent](#) [add, remove, raise]  
*Event fires when an entry of a table changed*
- [OnGetTableNamebyIndex](#)^ [GetTableNamebyIndexEvent](#) [add, remove, raise]  
*Event fires when the name of the table for the table number has changed*
- [OnGetActiveRunningTableNumber](#)^ [GetActiveRunningTableNumberEvent](#) [add, remove, raise]  
*Event fires when the table number has changed*
- [OnGetCurrentNumberOfValves](#)^ [GetCurrentNumberOfValvesEvent](#) [add, remove, raise]  
*Event fires when the number of valves has changed*
- [OnGetValveBoardRevision](#)^ [GetValveBoardRevisionEvent](#) [add, remove, raise]  
*Event fires when the revision code has changed*
- [OnGetValveLedOn](#)^ [GetValveLedOnEvent](#) [add, remove, raise]  
*Event fires when the LED state has changed*
- [OnGetDisplayMode](#)^ [GetDisplayModeEvent](#) [add, remove, raise]  
*Event fires when the display mode has changed*

## Additional Inherited Members

### 11.125.1 Detailed Description

[CWarnerValveControllerDeviceNet](#) is the class to access the Warner Valve Controller

## 11.125.2 Constructor & Destructor Documentation

### 11.125.2.1 CWarnerValveControllerDeviceNet() CWarnerValveControllerDeviceNet ( )

Initializes a new instance of the CWarnerValveControllerDeviceNet class.

### 11.125.2.2 ~CWarnerValveControllerDeviceNet() virtual ~CWarnerValveControllerDeviceNet ( ) [virtual]

### 11.125.2.3 !CWarnerValveControllerDeviceNet() !CWarnerValveControllerDeviceNet ( )

## 11.125.3 Member Function Documentation

### 11.125.3.1 ClearTableName() void ClearTableName ( )

Clear the name of current protocol table

### 11.125.3.2 ClearValveTable() void ClearValveTable ( uint16\_t valve )

Clear the valve protocol table

#### Parameters

<i>valve</i>	The valve number
--------------	------------------

### 11.125.3.3 GetActiveRunningTableNumber() uint32\_t GetActiveRunningTableNumber ( )

Gets the number of the table that is active for running

#### Returns

The table number

**11.125.3.4 GetAnalogThresholdHigh()** `int32_t GetAnalogThresholdHigh ( uint16_t valve )`

Gets the upper threshold for the analog in port per valve

**Parameters**

<i>valve</i>	The valve number
--------------	------------------

**Returns**

The threshold in mV

**11.125.3.5 GetAnalogThresholdLow()** `int32_t GetAnalogThresholdLow ( uint16_t valve )`

Gets the lower threshold for the analog in port per valve

**Parameters**

<i>valve</i>	The valve number
--------------	------------------

**Returns**

The threshold in mV

**11.125.3.6 GetAnalogVoltage()** `int32_t GetAnalogVoltage ( )`

Reads the voltage on the analog in port

**Returns**

The voltage in mV

**11.125.3.7 GetCurrentEditTableNumber()** `uint32_t GetCurrentEditTableNumber ( )`

Gets the number of the table that is current for editing

**Returns**

The table number

**11.125.3.8 GetCurrentNumberOfValves()** `int32_t GetCurrentNumberOfValves ( )`

Get the current number of valves connected to the system

**Returns**

The number of valves

**11.125.3.9 GetDigitalOutPortValve()** `uint32_t GetDigitalOutPortValve ( uint16_t digitalOutPort )`

Gets the number of the valve which is mapped to a digital out port

**Parameters**

<i>digitalOutPort</i>	The digital out port
-----------------------	----------------------

**Returns**

The valve number

**11.125.3.10 GetDigitalPortDirection()** `PortDirectionEnumNet GetDigitalPortDirection ( uint16_t port )`

Gets the direction of a digital port

**Parameters**

<i>port</i>	The port number
-------------	-----------------

**Returns**

the direction

**11.125.3.11 GetDisplayMode()** `WvcDisplayModeEnumNet GetDisplayMode ( )`

Reads the display mode

**Returns**

The display mode

**11.125.3.12 GetTableName()** `String ^ GetTableName ( )`

Get the name of the current protocol table

**Returns**

The name of the table

**11.125.3.13 GetTableNamebyIndex()** `String ^ GetTableNamebyIndex (   
uint16_t tableNumber )`

Get the name of a protocol table

**Parameters**

<i>tableNumber</i>	The table number
--------------------	------------------

**Returns**

The name of the table

**11.125.3.14 GetTotalNumberOfDigitalPorts()** `int32_t GetTotalNumberOfDigitalPorts ( )`

Get the total number of digital ports in the system

**Returns**

The number of digital ports

**11.125.3.15 GetTotalNumberOfTables()** `int32_t GetTotalNumberOfTables ( )`

Get the total number of tables in the system

**Returns**

The number of tables

**11.125.3.16 GetTotalNumberOfValves()** `int32_t GetTotalNumberOfValves ( )`

Get the total number of valves in the system

**Returns**

The number of valves

**11.125.3.17 GetTotalTableSize()** `int32_t GetTotalTableSize ( )`

Get the total table size in the system

**Returns**

The table size

**11.125.3.18 GetValveActive()** `int GetValveActive (   
uint16_t valve )`

Gets the valve active/inactive state

**Parameters**

<i>valve</i>	The valve number
--------------	------------------

**Returns**

The valve state

**11.125.3.19 GetValveBoardRevision()** `uint32_t GetValveBoardRevision ( )`

Gets the revision code of the valve board

**Returns**

The revision code

**11.125.3.20 GetValveBoardRevisionString()** `String ^ GetValveBoardRevisionString ( )`

Gets the revision name of the valve board

**Returns**

The revision name

**11.125.3.21 GetValveCurrent()** `void GetValveCurrent (`  
    `[System::Runtime::InteropServices::Out] int16_t% switch_current,`  
    `[System::Runtime::InteropServices::Out] int16_t% hold_current )`

Gets the valve currents

**Parameters**

<i>switch_current</i>	The switch current (in DAC units)
<i>hold_current</i>	The hold current (in DAC units)

**11.125.3.22 GetValveDigitalInPort()** `uint32_t GetValveDigitalInPort (`  
    `uint16_t valve )`

Gets the number of the digital in port which is mapped to a valve

**Parameters**

<i>valve</i>	The valve number
--------------	------------------

**Returns**

The digital in port

**11.125.3.23 GetValveLedOn()** `bool GetValveLedOn ( )`

Gets the LED state of the valve board

**Returns**

The LED state

**11.125.3.24 GetValveManualGroup()** `int32_t GetValveManualGroup (`  
    `uint16_t valve )`

Gets the valve manual group

**Parameters**

<i>valve</i>	The valve number
--------------	------------------

**Returns**

The manual valve group

**11.125.3.25 GetValveManualState()** `int32_t GetValveManualState ( uint16_t valve )`

Gets the valve manual on/off state

**Parameters**

<i>valve</i>	The valve number
--------------	------------------

**Returns**

The manual valve state

**11.125.3.26 GetValveMode()** `WvcValveModeEnumNet GetValveMode ( uint16_t valve )`

Reads the valve mode

**Parameters**

<i>valve</i>	The valve number
--------------	------------------

**Returns**

The valve mode

**11.125.3.27 GetValvesActiveMap()** `uint32_t GetValvesActiveMap ( )`

Gets the valves active/inactive states

**Returns**

The valves states

**11.125.3.28 GetValvesManualStateMap()** `uint32_t GetValvesManualStateMap ( )`

Gets the valves manual on/off states

**Returns**

The manual valves states

**11.125.3.29 GetValveTableEntry()** `void GetValveTableEntry (`  
`uint16_t valve,`  
`uint16_t index,`  
`[System::Runtime::InteropServices::Out] uint32_t% duration,`  
`[System::Runtime::InteropServices::Out] bool% state )`

Read an entry from the valve protocol table

**Parameters**

<i>valve</i>	The valve number
<i>index</i>	The index in the table
<i>duration</i>	the duration in ms
<i>state</i>	the state

**11.125.3.30 IsDigitalOutPortInverted()** `bool IsDigitalOutPortInverted (`  
`uint16_t digitalOutPort )`

Gets the number of the valve which is mapped to a digital out port

**Parameters**

<i>digitalOutPort</i>	The digital out port
-----------------------	----------------------

**Returns**

is inverted

**11.125.3.31 IsValveDigitalInInverted()** `bool IsValveDigitalInInverted (`  
`uint16_t valve )`

Is digital in inverted

**Parameters**

<i>valve</i>	The valve number
--------------	------------------

**Returns**

is inverted

**11.125.3.32 IsValveOpen()** `bool IsValveOpen (`  
`uint16_t valve )`

Is valve open

**Parameters**

<i>valve</i>	The valve number
--------------	------------------

**Returns**

is open

**11.125.3.33 IsValveOpenInAnalogMode()** `bool IsValveOpenInAnalogMode (`  
`uint16_t valve )`

True, if the valve would be open when the device is in analog mode

**Parameters**

<i>valve</i>	The valve number
--------------	------------------

**Returns**

is open

**11.125.3.34 IsValveOpenInDigitalMode()** `bool IsValveOpenInDigitalMode (`  
`uint16_t valve )`

True, if the valve would be open when the device is in digital mode

**Parameters**

<i>valve</i>	The valve number
--------------	------------------

**Returns**

is open

**11.125.3.35 LoadValveTable()** `void LoadValveTable ( )`

Load the current table from permanent memory

**11.125.3.36 OnGetActiveRunningTableNumber()** `delegate void OnGetActiveRunningTableNumber (   
 uint32_t tableNumber )`

**11.125.3.37 OnGetAnalogThresholdHigh()** `delegate void OnGetAnalogThresholdHigh (   
 uint16_t valve,   
 int32_t threshold )`

**11.125.3.38 OnGetAnalogThresholdLow()** `delegate void OnGetAnalogThresholdLow (   
 uint16_t valve,   
 int32_t threshold )`

**11.125.3.39 OnGetAnalogVoltage()** `delegate void OnGetAnalogVoltage (   
 int32_t voltage )`

**11.125.3.40 OnGetCurrentNumberOfValves()** `delegate void OnGetCurrentNumberOfValves (   
 int32_t numberOfValves )`

**11.125.3.41 OnGetDigitalOutPortValve()** `delegate void OnGetDigitalOutPortValve (   
 uint16_t digitalOutPort,   
 uint32_t valve )`

**11.125.3.42 OnGetDigitalPortDirection()** `delegate void OnGetDigitalPortDirection (   
 uint16_t port,   
 PortDirectionEnumNet direction )`

**11.125.3.43 OnGetDisplayMode()** `delegate void OnGetDisplayMode (   
 WvcDisplayModeEnumNet DisplayMode )`

**11.125.3.44 OnGetTableNamebyIndex()** delegate void OnGetTableNamebyIndex (   
     uint16\_t *tableNumber*,   
     String^ *tableName* )

**11.125.3.45 OnGetValveActive()** delegate void OnGetValveActive (   
     uint16\_t *valve*,   
     int *valveActive* )

**11.125.3.46 OnGetValveBoardRevision()** delegate void OnGetValveBoardRevision (   
     uint32\_t *revision* )

**11.125.3.47 OnGetValveDigitalInPort()** delegate void OnGetValveDigitalInPort (   
     uint16\_t *valve*,   
     uint32\_t *digitalInPort* )

**11.125.3.48 OnGetValveLedOn()** delegate void OnGetValveLedOn (   
     bool *ledon* )

**11.125.3.49 OnGetValveManualGroup()** delegate void OnGetValveManualGroup (   
     uint16\_t *valve*,   
     int32\_t *valveManualGroup* )

**11.125.3.50 OnGetValveManualState()** delegate void OnGetValveManualState (   
     uint16\_t *valve*,   
     int32\_t *valveManualState* )

**11.125.3.51 OnGetValveMode()** delegate void OnGetValveMode (   
     uint16\_t *valve*,   
     WvcValveModeEnumNet *ValveMode* )

**11.125.3.52 OnIsDigitalOutPortInverted()** `delegate void OnIsDigitalOutPortInverted (`  
    `uint16_t digitalOutPort,`  
    `bool isInverted )`

**11.125.3.53 OnIsValveDigitalInInverted()** `delegate void OnIsValveDigitalInInverted (`  
    `uint16_t valve,`  
    `bool isInverted )`

**11.125.3.54 OnIsValveOpen()** `delegate void OnIsValveOpen (`  
    `uint16_t valve,`  
    `bool valveOpen )`

**11.125.3.55 OnIsValveOpenInAnalogMode()** `delegate void OnIsValveOpenInAnalogMode (`  
    `uint16_t valve,`  
    `bool valveOpen )`

**11.125.3.56 OnIsValveOpenInDigitalMode()** `delegate void OnIsValveOpenInDigitalMode (`  
    `uint16_t valve,`  
    `bool valveOpen )`

**11.125.3.57 OnTableEntryChanged()** `delegate void OnTableEntryChanged (`  
    `uint16_t tableNumber )`

**11.125.3.58 SetActiveRunningTableNumber()** `void SetActiveRunningTableNumber (`  
    `uint32_t tableNumber )`

Sets the number of the tanle that is active for running

#### Parameters

<i>tableNumber</i>	The table number
--------------------	------------------

**11.125.3.59 SetAnalogThresholdHigh()** `void SetAnalogThresholdHigh (`  
    `uint16_t valve,`  
    `int32_t threshold )`

Sets the upper threshold for the analog in port per valve

#### Parameters

<i>valve</i>	The valve number
<i>threshold</i>	The threshold in mV

**11.125.3.60 SetAnalogThresholdLow()** `void SetAnalogThresholdLow (`  
    `uint16_t valve,`  
    `int32_t threshold )`

Sets the lower threshold for the analog in port per valve

#### Parameters

<i>valve</i>	The valve number
<i>threshold</i>	The threshold in mV

**11.125.3.61 SetCurrentEditTableNumber()** `void SetCurrentEditTableNumber (`  
    `uint32_t tableNumber )`

Sets the number of the table that is current for editing

#### Parameters

<i>tableNumber</i>	The table number
--------------------	------------------

**11.125.3.62 SetDefault()** `void SetDefault ( )`

Sets the settings of the valve controller to default

**11.125.3.63 SetDigitalOutPortInvert()** `void SetDigitalOutPortInvert (`  
    `uint16_t digitalOutPort,`  
    `bool isInverted )`

Map a valve to a digital out port

#### Parameters

<i>digitalOutPort</i>	The digital out port
<i>isInverted</i>	True if digital out is to be inverted

**11.125.3.64 SetDigitalOutPortValve()** `void SetDigitalOutPortValve (`  
    `uint16_t digitalOutPort,`  
    `uint32_t valve )`

Map a valve to a digital out port

**Parameters**

<i>digitalOutPort</i>	The digital out port
<i>valve</i>	The valve number

**11.125.3.65 SetDigitalPortDirection()** `void SetDigitalPortDirection (`  
    `uint16_t port,`  
    `PortDirectionEnumNet direction )`

Sets the direction of a digital port

**Parameters**

<i>port</i>	The port number
<i>direction</i>	the direction

**11.125.3.66 SetDisplayMode()** `void SetDisplayMode (`  
    `WvcDisplayModeEnumNet DisplayMode,`  
    `int32_t lockTimeMs )`

Writes the display mode

**Parameters**

<i>DisplayMode</i>	The display mode
<i>lockTimeMs</i>	Locks the display for ms

**11.125.3.67 SetTableName()** `void SetTableName (`  
    `String^ tableName )`

Set the name of the current protocol table

**Parameters**

<i>tableName</i>	The name of the table
------------------	-----------------------

**11.125.3.68 SetTableStep()** `void SetTableStep (`  
    `uint16_t valve,`  
    `int32_t steps )`

Skips the table protocol for a valve by steps

Parameters

<i>valve</i>	The valve number
<i>steps</i>	Number of steps

**11.125.3.69 SetTableStepAll()** `void SetTableStepAll (`  
    `int32_t steps )`

Skips the table protocol for all valves by steps

Parameters

<i>steps</i>	Number of steps
--------------	-----------------

**11.125.3.70 SetValveActive()** `void SetValveActive (`  
    `uint16_t valve,`  
    `int valveActive )`

Sets the valve active/inactive state

Parameters

<i>valve</i>	The valve number
<i>valveActive</i>	The valve state

**11.125.3.71 SetValveCurrent()** `void SetValveCurrent (`  
    `int16_t switch_current,`  
    `int16_t hold_current )`

Sets the valve currents different from the default

Parameters

<i>switch_current</i>	The switch current (in DAC units); -1 sets the device default current
<i>hold_current</i>	The hold current (in DAC units); -1 sets the device default current

**11.125.3.72 SetValveDigitalInInvert()** `void SetValveDigitalInInvert (`  
    `uint16_t valve,`  
    `bool isInverted )`

Invert digital in

**Parameters**

<i>valve</i>	The valve number
<i>isInverted</i>	True if digital in is to be inverted

**11.125.3.73 SetValveDigitalInPort()** `void SetValveDigitalInPort (`  
    `uint16_t valve,`  
    `uint32_t digitalInPort )`

Map a digital in port to a valve

**Parameters**

<i>valve</i>	The valve number
<i>digitalInPort</i>	The digital in port

**11.125.3.74 SetValveLedOn()** `void SetValveLedOn (`  
    `bool ledon )`

Gets the LED state of the valve board

**Parameters**

<i>ledon</i>	The LED state
--------------	---------------

**11.125.3.75 SetValveManualGroup()** `void SetValveManualGroup (`  
    `uint16_t valve,`  
    `int32_t valveManualGroup )`

Sets the valve manual group

**Parameters**

<i>valve</i>	The valve number
<i>valveManualGroup</i>	The manual valve group

**11.125.3.76 SetValveManualState()** `void SetValveManualState (`  
    `uint16_t valve,`  
    `int32_t valveManualState )`

Sets the valve manual on/off state

Parameters

<i>valve</i>	The valve number
<i>valveManualState</i>	The manual valve state

**11.125.3.77 SetValveMode()** `void SetValveMode (`  
    `uint16_t valve,`  
    `WvcValveModeEnumNet ValveMode )`

Writes the valve mode

Parameters

<i>valve</i>	The valve number
<i>ValveMode</i>	The valve mode

**11.125.3.78 SetValvesActiveMap()** `void SetValvesActiveMap (`  
    `uint32_t valvesActive )`

Sets the valve active/inactive state

Parameters

<i>valvesActive</i>	The valves states
---------------------	-------------------

**11.125.3.79 SetValvesManualStateMap()** `void SetValvesManualStateMap (`  
    `uint32_t valveaManualState )`

Sets the valve manual on/off state

Parameters

<i>valveaManualState</i>	The manual valves states
--------------------------	--------------------------

**11.125.3.80 SetValveTableEntry()** `void SetValveTableEntry (`  
    `uint16_t valve,`  
    `uint16_t index,`  
    `uint32_t duration,`  
    `bool state )`

Write an entry to the valve protocol table

**Parameters**

<i>valve</i>	The valve number
<i>index</i>	The index in the table
<i>duration</i>	the duration in ms
<i>state</i>	the state

**11.125.3.81 StoreValveTable()** `void StoreValveTable ( )`

Store the current table in permanent memory

## 11.125.4 Event Documentation

**11.125.4.1 GetActiveRunningTableNumberEvent** `OnGetActiveRunningTableNumber^ GetActiveRunning↵`  
`TableNumberEvent [add], [remove], [raise]`

Event fires when the table number has changed

**11.125.4.2 GetAnalogThresholdHighEvent** `OnGetAnalogThresholdHigh^ GetAnalogThresholdHighEvent`  
`[add], [remove], [raise]`

Event fires when the threshold in mV for the valve number has changed

**11.125.4.3 GetAnalogThresholdLowEvent** `OnGetAnalogThresholdLow^ GetAnalogThresholdLowEvent`  
`[add], [remove], [raise]`

Event fires when the threshold in mV for the valve number has changed

**11.125.4.4 GetAnalogVoltageEvent** `OnGetAnalogVoltage^ GetAnalogVoltageEvent [add], [remove], [raise]`

Event fires when the voltage in mV has changed

**11.125.4.5 GetCurrentNumberOfValvesEvent** `OnGetCurrentNumberOfValves^ GetCurrentNumberOfValvesEvent [add], [remove], [raise]`

Event fires when the number of valves has changed

**11.125.4.6 GetDigitalOutPortValveEvent** `OnGetDigitalOutPortValve^ GetDigitalOutPortValveEvent [add], [remove], [raise]`

Event fires when the valve number for the digital out port has changed

**11.125.4.7 GetDigitalPortDirectionEvent** `OnGetDigitalPortDirection^ GetDigitalPortDirectionEvent [add], [remove], [raise]`

Event fires when the direction for the port number has changed

**11.125.4.8 GetDisplayModeEvent** `OnGetDisplayMode^ GetDisplayModeEvent [add], [remove], [raise]`

Event fires when the display mode has changed

**11.125.4.9 GetTableNamebyIndexEvent** `OnGetTableNamebyIndex^ GetTableNamebyIndexEvent [add], [remove], [raise]`

Event fires when the name of the table for the table number has changed

**11.125.4.10 GetValveActiveEvent** `OnGetValveActive^ GetValveActiveEvent [add], [remove], [raise]`

Event fires when the valve state for the valve number has changed

**11.125.4.11 GetValveBoardRevisionEvent** [OnGetValveBoardRevision](#)<sup>^</sup> GetValveBoardRevisionEvent  
[add], [remove], [raise]

Event fires when the revision code has changed

**11.125.4.12 GetValveDigitalInPortEvent** [OnGetValveDigitalInPort](#)<sup>^</sup> GetValveDigitalInPortEvent [add],  
[remove], [raise]

Event fires when the digital in port for the valve number has changed

**11.125.4.13 GetValveLedOnEvent** [OnGetValveLedOn](#)<sup>^</sup> GetValveLedOnEvent [add], [remove], [raise]

Event fires when the LED state has changed

**11.125.4.14 GetValveManualGroupEvent** [OnGetValveManualGroup](#)<sup>^</sup> GetValveManualGroupEvent [add],  
[remove], [raise]

Event fires when the manual valve group for the valve number has changed

**11.125.4.15 GetValveManualStateEvent** [OnGetValveManualState](#)<sup>^</sup> GetValveManualStateEvent [add],  
[remove], [raise]

Event fires when the manual valve state for the valve number has changed

**11.125.4.16 GetValveModeEvent** [OnGetValveMode](#)<sup>^</sup> GetValveModeEvent [add], [remove], [raise]

Event fires when the valve mode for the valve number has changed

**11.125.4.17 IsDigitalOutPortInvertedEvent** [OnIsDigitalOutPortInverted](#)<sup>^</sup> IsDigitalOutPortInverted↔  
Event [add], [remove], [raise]

Event fires when is inverted for the digital out port has changed

**11.125.4.18 IsValveDigitalInInvertedEvent** [OnIsValveDigitalInInverted](#)<sup>^</sup> IsValveDigitalInInverted↔  
Event [add], [remove], [raise]

Event fires when is inverted for the valve number has changed

**11.125.4.19 IsValveOpenEvent** [OnIsValveOpen](#)<sup>^</sup> IsValveOpenEvent [add], [remove], [raise]

Event fires when is open for the valve number has changed

**11.125.4.20 IsValveOpenInAnalogModeEvent** [OnIsValveOpenInAnalogMode](#)<sup>^</sup> IsValveOpenInAnalogMode↔  
Event [add], [remove], [raise]

Event fires when is open for the valve number has changed

**11.125.4.21 IsValveOpenInDigitalModeEvent** [OnIsValveOpenInDigitalMode](#)<sup>^</sup> IsValveOpenInDigital↔  
ModeEvent [add], [remove], [raise]

Event fires when is open for the valve number has changed

**11.125.4.22 TableEntryChangedEvent** [OnTableEntryChanged](#)<sup>^</sup> TableEntryChangedEvent [add], [remove], [raise]

Event fires when an entry of a table changed

## 11.126 CWarnerValveControllerDeviceTesterFunctionNet Class Reference

[CWarnerValveControllerDeviceTesterFunctionNet](#) is the class to access the functions for the Warner Valve Controller Device Tester

### 11.126.3 Member Function Documentation

**11.126.3.1** `GetIO()` `uint32_t GetIO ( )`

Gets the output from the io ports

#### Returns

The manual valves states

**11.126.3.2** `GetSync()` `uint32_t GetSync ( )`

Gets the output from the sync port

#### Returns

The sync state

**11.126.3.3** `SetADC()` `void SetADC ( uint32_t onoff )`

Sets the ADC port of the tester

#### Parameters

<i>onoff</i>	The port state
--------------	----------------

**11.126.3.4** `SetIO()` `void SetIO ( uint32_t io )`

Sets the input to the io ports

**Parameters**

<i>io</i>	The manual valves states
-----------	--------------------------

**11.126.3.5 SetIODirection()** `void SetIODirection (`  
`int32_t direction )`

Sets the direction of the IO test ports

**Parameters**

<i>direction</i>	The 16bit direction map: 1=IN 0=OUT
------------------	-------------------------------------

**11.126.3.6 SetTrigger()** `void SetTrigger (`  
`uint32_t trigger )`

Sets the input to the trigger port

**Parameters**

<i>trigger</i>	The trigger state
----------------	-------------------

**11.126.3.7 SetTriggerSyncDirection()** `void SetTriggerSyncDirection (`  
`uint32_t direction )`

Sets the direction of the trigger/sync test port

**Parameters**

<i>direction</i>	The direction: 1=IN 0=OUT
------------------	---------------------------

#### 11.132.1 Detailed Description

Class gives firmware versions of the device's firmware destinations.

#### 11.132.2 Constructor & Destructor Documentation

##### 11.132.2.1 [DriverVersionNet\(\)](#) [DriverVersionNet](#) ( )

Constructor.

##### 11.132.2.2 [~DriverVersionNet\(\)](#) [~DriverVersionNet](#) ( )

Destructor.

#### 11.132.3 Member Function Documentation

**11.132.3.1 DriverVersionNet::FormatVersion()** `static String ^ DriverVersionNet::FormatVersion ( unsigned int v ) [static]`

**11.132.3.2 GetDestinationCode()** `CFirmwareDestinationNet GetDestinationCode ( unsigned int index )`

Get CFirmwareDestinationNet.

## Parameters

<i>index</i>	by index of firmware destination
--------------	----------------------------------

**11.132.3.3 GetDestinationName()** [1/2] `String ^ GetDestinationName ( CFirmwareDestinationNet dest )`

Get firmware destination name.

## Parameters

<i>dest</i>	by CFirmwareDestinationNet
-------------	----------------------------

**11.132.3.4 GetDestinationName()** [2/2] `String ^ GetDestinationName ( unsigned int index )`

Get firmware destination name.

## Parameters

<i>index</i>	by index of firmware destination
--------------	----------------------------------

**11.132.3.5 GetMajor()** [1/2] `unsigned int GetMajor ( CFirmwareDestinationNet dest )`

Get the major version number of firmware destination.

## Parameters

<i>dest</i>	by CFirmwareDestinationNet
-------------	----------------------------

**11.132.3.6 GetMajor()** [2/2] `unsigned int GetMajor ( unsigned int index )`

Get the major version number of firmware destination.

## Parameters

<i>index</i>	by index of firmware destination
--------------	----------------------------------

**11.132.3.7 GetMinor()** [1/2] unsigned int GetMinor (   
 CFirmwareDestinationNet dest )

Get the minor version number of firmware destination.

Parameters

<i>dest</i>	by CFirmwareDestinationNet
-------------	----------------------------

**11.132.3.8 GetMinor()** [2/2] unsigned int GetMinor (   
 unsigned int index )

Get the minor version number of firmware destination.

Parameters

<i>index</i>	by index of firmware destination
--------------	----------------------------------

**11.132.3.9 GetNumEntries()** unsigned int GetNumEntries ( )

Get the number of available firmware destinations.

**11.132.3.10 GetSerialNumber()** [1/2] String ^ GetSerialNumber (   
 CFirmwareDestinationNet dest )

Get the serial number of the destination, when no serial number if found, return an empty string.

Parameters

<i>dest</i>	by CFirmwareDestinationNet
-------------	----------------------------

**11.132.3.11 GetSerialNumber()** [2/2] String ^ GetSerialNumber (   
 unsigned int index )

Get the serial number of the destination, when no serial number if found, return an empty string.

## Parameters

<i>index</i>	by index of firmware destination
--------------	----------------------------------

**11.132.3.12 GetStatus()** [1/2] unsigned int GetStatus (   
CFirmwareDestinationNet *dest* )

Get status of firmware destination.

## Parameters

<i>dest</i>	by CFirmwareDestinationNet
-------------	----------------------------

**11.132.3.13 GetStatus()** [2/2] unsigned int GetStatus (   
unsigned int *index* )

Get status of firmware destination.

## Parameters

<i>index</i>	by index of firmware destination
--------------	----------------------------------

**11.132.3.14 GetVersionInt()** [1/2] unsigned int GetVersionInt (   
CFirmwareDestinationNet *dest* )

Get the version number of firmware destination (major in high word, minor in low word)

## Parameters

<i>dest</i>	by CFirmwareDestinationNet
-------------	----------------------------

**11.132.3.15 GetVersionInt()** [2/2] unsigned int GetVersionInt (   
unsigned int *index* )

Get the version number of firmware destination (major in high word, minor in low word)

## Parameters

<i>index</i>	by index of firmware destination
--------------	----------------------------------

**11.132.3.16 GetVersionString() [1/2]** `String ^ GetVersionString ( CFirmwareDestinationNet dest )`

Get the version as a string in the format Major.Minor.

Parameters

<i>dest</i>	by CFirmwareDestinationNet
-------------	----------------------------

**11.132.3.17 GetVersionString() [2/2]** `String ^ GetVersionString ( unsigned int index )`

Get the version as a string in the format Major.Minor.

Parameters

<i>index</i>	by index of firmware
--------------	----------------------

## 11.134 HeadStageIDType Class Reference

Inheritance diagram for HeadStageIDType:

## Public Types

- enum class [HeadstageTypeEnum](#) {  
    [Unknown](#) ,  
    [MeasuringOnly](#) ,  
    [OpticalStimulation](#) ,  
    [ElectricalStimulation](#) }

## Public Member Functions

- [HeadStageIDType](#) (unsigned int entry, [CW2100\\_FunctionNet](#)^ device)
- virtual System::String ^ [ToString](#) () override
- virtual bool [Equals](#) (Object^ obj) override
- virtual Int32 [CompareTo](#) (Object^ obj)

## Properties

- bool [Valid](#) [get]
- unsigned int [Entry](#) [get]
- unsigned short [ID](#) [get]
- System::String ^ [SN](#) [get]
- unsigned int [TypeValue](#) [get]
- System::String ^ [Type](#) [get]
- [HeadstageTypeEnum](#) [HeadstageType](#) [get]
- System::String ^ [UserDefinedName](#) [get]
- int [NumberOfAnalogChannels](#) [get]
- int [NumberOfStimulationChannels](#) [get]
- [W2100\\_StimulusParametersNet](#)^ [StimulusParameters](#) [get]
- bool [HasIMU](#) [get]
- bool [W16IsW14](#) [get]
- bool [HasOptoCurrentMeasurement](#) [get]

### 11.134.1 Member Enumeration Documentation

#### 11.134.1.1 HeadstageTypeEnum enum [HeadstageTypeEnum](#) [strong]

##### Enumerator

<a href="#">Unknown</a>	
<a href="#">MeasuringOnly</a>	
<a href="#">OpticalStimulation</a>	
<a href="#">ElectricalStimulation</a>	

### 11.134.2 Constructor & Destructor Documentation

**11.134.2.1 HeadStageIDType()** `HeadStageIDType (`  
    `unsigned int entry,`  
    `CW2100_FunctionNet^ device )`

### 11.134.3 Member Function Documentation

**11.134.3.1 CompareTo()** `virtual Int32 CompareTo (`  
    `Object^ obj ) [virtual]`

**11.134.3.2 Equals()** `virtual bool Equals (`  
    `Object^ obj ) [override], [virtual]`

**11.134.3.3 ToString()** `virtual System::String ^ ToString ( ) [override], [virtual]`

### 11.134.4 Property Documentation

**11.134.4.1 Entry** `unsigned int Entry [get]`

**11.134.4.2 HasIMU** `bool HasIMU [get]`

**11.134.4.3 HasOptoCurrentMeasurement** `bool HasOptoCurrentMeasurement [get]`

**11.134.4.4 HeadstageType** `HeadstageTypeEnum HeadstageType [get]`

**11.134.4.5 ID** `unsigned short ID [get]`

**11.134.4.6 NumberOfAnalogChannels** `int NumberOfAnalogChannels [get]`

**11.134.4.7 NumberOfStimulationChannels** `int NumberOfStimulationChannels [get]`

**11.134.4.8 SN** `System:: String^ SN [get]`

**11.134.4.9 StimulusParameters** `W2100_StimulusParametersNet^ StimulusParameters [get]`

**11.134.4.10 Type** `System:: String^ Type [get]`

**11.134.4.11 TypeValue** `unsigned int TypeValue [get]`

**11.134.4.12 UserDefinedName** `System:: String^ UserDefinedName [get]`

**11.134.4.13 Valid** `bool Valid [get]`

**11.134.4.14 W16IsW14** `bool W16IsW14 [get]`

**11.138.1.22 GetUserParameter() [1/2]** void GetUserParameter (   
 unsigned short *index*,   
 [System::Runtime::InteropServices::Out] int% *value* )

Reads 32 bit integer values stored persistently on RoboMain

intention: provide free persistent user memory space on motor controller

#### Parameters

<i>index</i>	address offset of parameter; range: 0..15
<i>value</i>	data buffer

**11.138.1.23 GetUserParameter() [2/2]** void GetUserParameter (   
 unsigned short *index*,   
 [System::Runtime::InteropServices::Out] unsigned int% *value* )

Reads 32 bit integer values stored persistently on RoboMain

intention: provide free persistent user memory space on motor controller

#### Parameters

<i>index</i>	address offset of parameter; range: 0..15
<i>value</i>	data buffer

**11.138.1.24 HasRef()** unsigned char HasRef (   
 unsigned char *busaddress*,   
 char *axes* )

**11.138.1.25 SetAxisConfig()** void SetAxisConfig (   
 unsigned char *busaddress*,   
 char *axes*,   
 unsigned int *config* )

**11.138.1.26 SetHWConfig()** void SetHWConfig (   
 unsigned int *config* )

**11.138.1.27 SetHWRevision()** void SetHWRevision (   
 unsigned int *revision* )

**11.138.1.28 SetMaxNoPressure()** void SetMaxNoPressure (   
 unsigned int *pressure* )

**11.138.1.29 SetMaxNoPressureWaitTime()** void SetMaxNoPressureWaitTime (   
 unsigned int *t* )

**11.138.1.30 SetMaxPressureWaitTime()** void SetMaxPressureWaitTime (   
 unsigned int *t* )

**11.138.1.31 SetMinNoPressureWaitTime()** void SetMinNoPressureWaitTime (   
 unsigned int *t* )

**11.138.1.32 SetMinPressure()** void SetMinPressure (   
 unsigned int *pressure* )

**11.138.1.33 SetMinPressureWaitTime()** void SetMinPressureWaitTime (   
 unsigned int *t* )

**11.138.1.34 SetParameter()** [1/2] void SetParameter (   
 unsigned short *command*,   
 unsigned short *index*,   
 unsigned int *value* )

**11.138.1.35 SetParameter()** [2/2] void SetParameter (   
 unsigned short *command*,   
 unsigned short *index*,   
 unsigned int *value1*,   
 unsigned int *value2* )

**11.138.1.36 SetSearchReferenceFastAccel()** void SetSearchReferenceFastAccel (   
 unsigned char *busaddress*,   
 char *axes*,   
 unsigned short *accel* )

**11.138.1.37 SetSearchReferenceFastSpeed()** void SetSearchReferenceFastSpeed (   
 unsigned char *busaddress*,   
 char *axes*,   
 unsigned short *speed* )

**11.138.1.38 SetSearchReferenceFineAccel()** void SetSearchReferenceFineAccel (   
 unsigned char *busaddress*,   
 char *axes*,   
 unsigned short *accel* )

**11.138.1.39 SetSearchReferenceFineSpeed()** void SetSearchReferenceFineSpeed (   
 unsigned char *busaddress*,   
 char *axes*,   
 unsigned short *speed* )

**11.138.1.40 SetSearchReferenceMethod()** `void SetSearchReferenceMethod (`  
    `unsigned char busaddress,`  
    `char axes,`  
    `unsigned int method )`

**11.138.1.41 SetSearchReferenceMoveOut()** `void SetSearchReferenceMoveOut (`  
    `unsigned char busaddress,`  
    `char axes,`  
    `int move )`

**11.138.1.42 SetSearchReferenceOffsetPos()** `void SetSearchReferenceOffsetPos (`  
    `unsigned char busaddress,`  
    `char axes,`  
    `int offsetpos )`

**11.138.1.43 SetUserParameter()** [1/2] `void SetUserParameter (`  
    `unsigned short index,`  
    `int value )`

Stores *persistently* 32 bit integer values on RoboMain

intention: provide free persistent user memory space on RoboMain

Parameters

<i>index</i>	address offset of parameter; range: 0..15
<i>value</i>	data to be stored

**11.138.1.44 SetUserParameter()** [2/2] `void SetUserParameter (`  
    `unsigned short index,`  
    `unsigned int value )`

Stores *persistently* 32 bit integer values on RoboMain

intention: provide free persistent user memory space on RoboMain

Parameters

<i>index</i>	address offset of parameter; range: 0..15
<i>value</i>	data to be stored

## 11.139 CRoboStatorDeviceNet::RoboMainStatorLowLevelCommands Class Reference

### Public Member Functions

- void [FindReferencePhase0XY](#) ()
- void [FindReferencePhase0XY](#) (int timeout)

#### 11.139.1 Member Function Documentation

**11.139.1.1 FindReferencePhase0XY()** [1/2] `void FindReferencePhase0XY ( )`

**11.139.1.2 FindReferencePhase0XY()** [2/2] `void FindReferencePhase0XY (   
int timeout )`

s_FilterAttributes attrib )`

#### 11.140.2 Member Function Documentation

**11.140.2.1 ToCpp()** `s_FilterAttributes ToCpp ( )`

### 11.140.3 Member Data Documentation

**11.140.3.1 CommaPositionA** `uint32_t CommaPositionA`

**11.140.3.2 CommaPositionB** `uint32_t CommaPositionB`

**11.140.3.3 PostCommaA** `uint32_t PostCommaA`

**11.140.3.4 PostCommaB** `uint32_t PostCommaB`

**11.140.3.5 PreCommaA** `uint32_t PreCommaA`

**11.140.3.6 PreCommaB** `uint32_t PreCommaB`

## 11.141 CMeaAudioFunctionNet::s\_setaudionet Struct Reference

### Public Attributes

- int [channel](#)
- int [amplification](#)

### 11.141.1 Member Data Documentation

**11.141.1.1 amplification** `int amplification`

11.141.1.2 **channel** `int channel`

## 11.142 CStimulusFunctionNet::SidebandData Class Reference

### Public Member Functions

- [SidebandData](#) ()
- [~SidebandData](#) ()  
*Destructor: called by Dispose()*
- [!SidebandData](#) ()  
*Finalizer: called by GC before collecting*

### Properties

- `array< int32_t >^` [Sideband](#) [get]
- `array< uint64_t >^` [Duration](#) [get]

### 11.142.1 Constructor & Destructor Documentation

11.142.1.1 **SidebandData()** [SidebandData](#) ( )

11.142.1.2 **~SidebandData()** [~SidebandData](#) ( )

Destructor: called by Dispose()

11.142.1.3 **!SidebandData()** [!SidebandData](#) ( )

Finalizer: called by GC before collecting

### 11.142.2 Property Documentation

11.142.2.1 **Duration** `array< uint64_t >^` [Duration](#) [get]

11.142.2.2 **Sideband** `array< int32_t >^` [Sideband](#) [get]

## 11.143 StgStatusNet Class Reference

### Static Public Member Functions

- static [StgStatusNet](#) ^ [FromIntPtr](#) (IntPtr stgstatus)
- static [StgStatusNet](#) ^ [FromPtr](#) (stgstatus\_t \*stgstatus)

### Public Attributes

- array< [Stg200xTriggerStatusEnumNet](#) > ^ [TiggerStatus](#)
- array< uint32\_t > ^ [ListOfChangedTriggers](#)

### 11.143.1 Member Function Documentation

**11.143.1.1 FromIntPtr()** static [StgStatusNet](#) ^ FromIntPtr (   
 IntPtr stgstatus ) [static]

**11.143.1.2 FromPtr()** static [StgStatusNet](#) ^ FromPtr (   
 stgstatus\_t \* stgstatus ) [static]

### 11.143.2 Member Data Documentation

**11.143.2.1 ListOfChangedTriggers** array<uint32\_t> ^ ListOfChangedTriggers

**11.143.2.2 TiggerStatus** array<[Stg200xTriggerStatusEnumNet](#)> ^ TiggerStatus

## 11.144 CStimulusFunctionNet::StimulusDeviceDataAndUnrolledData Class Reference

### Public Member Functions

- [StimulusDeviceDataAndUnrolledData](#) ()
- [~StimulusDeviceDataAndUnrolledData](#) ()  
*Destructor: called by Dispose()*
- [!StimulusDeviceDataAndUnrolledData](#) ()  
*Finalizer: called by GC before collecting*

## Properties

- array< uint8\_t >^ [DeviceData](#) [get]
- int [DeviceDataLength](#) [get]
- array< int32\_t >^ [UnrolledAmplitude](#) [get]
- array< uint32\_t >^ [UnrolledSync](#) [get]
- array< uint64\_t >^ [UnrolledDuration](#) [get]

### 11.144.1 Constructor & Destructor Documentation

**11.144.1.1** [StimulusDeviceDataAndUnrolledData\(\)](#) [StimulusDeviceDataAndUnrolledData](#) ( )

**11.144.1.2** [~StimulusDeviceDataAndUnrolledData\(\)](#) [~StimulusDeviceDataAndUnrolledData](#) ( )

Destructor: called by Dispose()

**11.144.1.3** ["!StimulusDeviceDataAndUnrolledData\(\)](#) [!StimulusDeviceDataAndUnrolledData](#) ( )

Finalizer: called by GC before collecting

### 11.144.2 Property Documentation

**11.144.2.1** [DeviceData](#) array< uint8\_t >^ [DeviceData](#) [get]

**11.144.2.2** [DeviceDataLength](#) int [DeviceDataLength](#) [get]
